Durbin, 1973-01-01 Presents a coherent body of theory for the derivation of the sampling distributions of a wide range of test statistics Emphasis is on the development of practical techniques A unified treatment of the theory was attempted e.g. the author sought to relate the derivations for tests on the circle and the two sample problem to the basic theory for the one sample problem on the line The Markovian nature of the sample distribution function is stressed as it accounts for the elegance of many of the results achieved as well as the close relation with parts of the theory of stochastic processes

Schaeffer,Kathleen. R. Richardson,Marlene Wightman,L. David Pye,2012-08-21 This publication provides an excellent one stop resource for understanding the most important current issues in the research in processing properties and applications in glass and optical materials **Enacting Electronic Government Success** J. Ramon Gil-Garcia,2012-02-28 Many

countries around the world are investing a great amount of resources in government IT initiatives However few of these projects achieve their stated goals and some of them are complete failures Therefore understanding e government success has become very important and urgent in recent years In order to develop relevant knowledge about this complex phenomenon researchers and practitioners need to identify and assess what are the main conditions variables or factors that have an impact on e government success However before being able to evaluate these impacts it is necessary to define what e government success is and what some e government success measures are This book presents a review of both e government success measures and e government success factors It also provides empirical evidence from quantitative analysis and two in depth case studies Although based on sound theory and rigorous empirical analysis the book not only

significantly contributes to academic knowledge but also includes some practical recommendations for government officials and public managers. Theoretically, the book proposes a way to quantitatively operationalize Fountain's enactment framework. Based on the institutional tradition, the technology enactment framework attempts to explain the effects of organizational forms and institutional arrangements on the information technology used by government agencies. According to Fountain (1995, 2001), the technology enactment framework pays attention to the relationships among information technology, organizations, embeddedness, and institutions. This framework is very well known in the e-government field but is normally used for qualitative analysis and there is no previous proposal of how to use it with quantitative data. The book proposes variables to measure each of the different constructs in this framework and also tests the relationships hypothesized by Fountain's theory. Finally, using the advantages of the selected quantitative analysis technique, Partial Least Squares, the study also proposes some adjustments and extensions to the original framework in a theory building effort. Methodologically, the book reports on one of the first multi-method studies in the field of e-government in general and e-government success in particular. This study uses a nested research design which combines statistical analysis with two in-depth case studies. The study begins with a statistical analysis using organizational, institutional, and contextual factors as the independent variables. An overall score representing e-government success in terms of the functionality of state websites is the dependent variable. Second, based on the statistical results, two cases are selected based on their relative fitness to the model residuals and their position in the general ranking of website functionality which includes four different measures. In order to complement the results of the statistical analysis, case studies were developed for the two selected states, New York and Indiana, using semi-structured interviews and document analysis. In terms of the statistical analysis, the book constitutes one of the first applications of Partial Least Squares (PLS) to an e-government success study. PLS is a structural equations modeling (SEM) technique and therefore allows estimating the measurement model and the structural model simultaneously. The use of this sophisticated statistical strategy helped to test the relationships between e-government success and different factors influencing it as well as some of the relationships between several of the factors, thus allowing exploring some indirect effects too.
