- **The Life-Cycle of a Sun-Like Star:** They begin as a nebula with gas and gravity. Then the mass forms a globule in the middle. Due to gravity the globule collapses and forms a spiraling disk of gas and dust. Then it forms a protostar with protoplanets. Then they become an active star with young planets. Then it becomes a solar system with the star in the middle. Then the sun-like star forms a red giant, then a planetary nebula, then a white dwarf and finally a black dwarf.
- We are located in the Milky Way galaxy which is a spiral (shape) galaxy. The Milky Way is located in the Local group which is within the Virgo supercluster. Our closest neighboring galaxy is called Andromeda.
- **The Big Bang Theory:** The Universe began as an extremely dense, single point. Due to high amounts of density, it became unstable and exploded. The Universe is constantly expanding with every second.
- **How Do We Know?** Scientists use light signals from telescopes to measure how objects in the universe move. We understand that objects are moving away from us because of Red Shift (longer wavelengths and lower frequencies). If objects were moving towards us, there would be Blue Shift (shorter wavelengths and higher frequencies).
