Population ecology is the study of populations in relation to environment, including environmental influences on density and distribution, age structure, and population size.

A **population** is a group of individuals of a single species living in the same general area. Natality and immigration increases it while mortality and emigration decreases it.

Density is the number of individuals per unit area or volume.

Dispersion is the pattern of spacing among individuals within the boundaries of the population. They can be **uniform, clumped, or random.**

Demography is the study of the vital statistics of a population and how they change over time. Its primary factors are the birth rate and death rate.

A **life table** is an age-specific summary of the survival pattern of a population. It is best made by following the fate of a **cohort.**

Survivorship curves plot the proportion of individuals alive at each age. There are **3 types** of survivorship curves:

- Type I: low death rates during early and middle life, then an increase in death rates among older age groups
- Type II: the death rate is constant over the organism's life span
- Type III: high death rates for the young, then a slower death rate for survivors
