Solid state portable radio receiver

Introduction

An outstanding feature of the Roberts RIC. 1 battery operated radio receiver is the incorporation of an integrated circuit device, a small capsule containing a series circuit of eleven transistors, eleven resistors and a diode. The familiar U.C. amplifier has disappeared, and the required degree of selectivity is achieved by means of a crystal filter.

Bandwidths covered are now: 550-1550m (1.645-5.455mc) and Low: 1.100-2.000m (220-400kc), reception is via either the internal ferrite rod aerial assembly or a car-type aerial for which a single point co-axial socket is fitted at the top of the case adjacent to the volume control knob.

Complementary symmetry is employed in the drive transistor a.c. amplifier which drives a 2in by 3½in S.C. elliptical loudspeaker which provides an audio output power in excess of 1W. A normally shielded miniature jack located at the top of the case adjacent to the tuning control knob enables it to be connected for personal listening, at the same time muting the internal loudspeaker.

Operating power is supplied by a 9V battery. Over Ready type PPS or its equivalent.

Voltage analysis

Voltages quoted in the table, col. 2, were obtained from data supplied by the manufacturer and are all positive with respect to battery negative. There was no signal input, the volume control was at minimum and tone was measured on a 50.00002V meter.
