Insert the shells as individual units into the grooves, using the following bearing carrier balls (check with the bearing carrier balls) until the balls are seated.

Tighten the flange bolts to the specified torques, the rear center and front center bolts are tightened to 40-45 ft.-lb. If the front center bolt loosening has been discovered, tighten the front center bolt through the Shimano lockers until the torque is a torque reading of 40-45 ft.-lb., while the rear shaft is held in the correct position.

When using new brackets along the center bearing mounting, ensure that they are of the correct thickness, as those fixed to H2 spurs are thicker than those fixed to H3 spurs and these would not be interchanged.
