

# Cochran's Sample Size Formula

- The Cochran formula allows to calculate an ideal sample size given a desired level of precision, desired confidence level, and the estimated proportion of the attribute present in the population.
- Cochran's formula is considered especially appropriate in situations with large populations. A sample of any given size provides more information about a smaller population than a larger one, so there's a 'correction' through which the number given by Cochran's formula can be reduced if the whole population is relatively small.

- The Cochran formula is:

$$n_0 = \frac{Z^2 pq}{e^2}$$

Where:  $e$  is the desired level of precision (i.e. the margin of error),

$p$  is the (estimated) proportion of the population which has the attribute in question,

$q$  is  $1 - p$ .

The  $z$  value is found in a  $Z$  table.
