Consolidation Analyses of Soils Jian-Hua Yin, Guofu Zhu, 2020-12-28 When stresses are applied to saturated soil, deformation will occur as water in voids is squeezed out. **Consolidation Analyses of Soils** focuses on the consolidation of fully saturated soils. The book follows a classic approach by beginning with one-dimensional constitutive relations of soils and one-dimensional consolidation. It then moves on to analytical solutions to several one-dimensional consolidation problems and one-dimensional finite strain consolidation. The authors also present a finite element method for consolidation analysis of one-dimensional problems, analytical solutions to consolidation of soil with vertical drains, and a finite difference method for consolidation analysis of one-dimensional problems. Simplified methods for consolidation analysis of soils exhibiting creep are introduced and applied to different cases. Three-dimensional consolidation equations and solutions of typical three-dimensional consolidation problems are covered, as well as simplified finite element consolidation analysis of soils with vertical drain and finite element method for three-dimensional consolidation problems. The book is unique in that it covers both classic solutions and state-of-the-art work in consolidation analyses of soils. Author Jian-Hua Yin is Chair Professor of Soil Mechanics in the Department of Civil and

River dyke failure modeling under transient water conditions Wilmer Ferney Morales Peñuela, 2015-11-26. Knowledge of the performance of river dykes during flooding is necessary when designing governmental assistance plans aimed to reduce both casualties and material damage. This is especially relevant when floods have increased in their frequency during the last decades, together with the resulting material damage and life costs. Most of previous attempts for analyzing dyke breaching during flooding have neglected to consider the soil mechanics component and the influence of infiltration and saturation changes on the failure mechanisms developed in the river dyke. This research project aimed to fill that gap in knowledge by analyzing in a comprehensive manner the effect of transient water conditions represented by successive flood cycles on the seepage conditions and subsequent breaching of dykes. Therefore, three key sub projects were carried out: the analysis of the results from an overflow

field test the physical modeling of small scaled models under an enhanced gravity field the numerical modeling of the flow response and the resulting stability of both the air and water side slopes The results from the numerical simulations matched accurately with the results obtained with the centrifuge modeling including the prediction of local instabilities during the flood cycles for those dykes that did not include a toe filter
