

CHAPTER 6:

Sinusoidal Functions

NOTE: Answers are given to the same number of decimal points as the numbers in each question.

Getting Started, p. 344

1. a) x represents the number of times the price is reduced by \$2. The factor $(30 - 2x)$ represents the price of one T-shirt in terms of the number of times the price is reduced; the factor $(100 + 20x)$ represents the total number of T-shirts sold in terms of the number of times the price is reduced.

b) Since the revenue generated by T-shirt sales can be modelled by the function $R(x) = (30 - 2x)(100 + 20x)$, for $R(x)$ to be equal to 0, one or both of the factors must be equal to 0. $100 + 20x$ can only be equal to 0 if x is negative, and this is not possible. Therefore, $30 - 2x = 0$.

$$-2x = -30$$

$$x = 15 \text{ times}$$

c) Create a table with two columns. In the first column put the number of price reductions. In the second column, put the corresponding revenue. Continue until the revenue starts to decrease.

Number of Price Reductions	Revenue (dollars) $R(x) = (30 - 2x)(100 + 20x)$
0	3000
1	3360
2	3640
3	3840
4	3960
5	4000
6	3960

The price will have to be dropped 5 times to reach the maximum revenue.

d) From the table created in part c, it's apparent that the maximum revenue is \$4000.

e) The price of a T-shirt is equal to $30 - 2x$, so to obtain the maximum revenue, the T-shirts will sell for $30 - 2(5)$ or 20 dollars.

f) The number of T-shirts sold is equal to $100 + 20x$, so to obtain the maximum revenue, $100 + 20(5)$ or 200 T-shirts will be sold.

2. a)

The puck travelled 180 cm to the opposite end of the table in the first 0.25 s and 180 cm back in the next 0.25 s for a total distance of 360 cm.

b) The puck was farthest away from where it was shot when it was 180 cm away, and this occurred after 0.25 s.

c) The puck travelled 180 cm in the first 0.25 s.

$$\frac{180 \text{ cm}}{0.25 \text{ s}} = \frac{720 \text{ cm}}{1 \text{ s}} = 720 \text{ cm/s}$$

d) The domain is all possible values of the time, or t , while the range is all possible values of the distance, or d . Therefore, the domain is $\{t \in \mathbb{R} \mid 0 \leq t \leq 0.5\}$, and the range is $\{d \in \mathbb{R} \mid 0 \leq d \leq 180\}$.

3. a)

Within the larger triangle there exist two smaller right triangles. The smaller right triangle with a hypotenuse of 15 cm has the measurements of two angles given: 40° and 90° . Therefore, the measurement of the unknown angle within that triangle is 50° . With that angle

Stochastic Differential Equations for Chemical Transformations in White Noise Probability Space Don

Kulasiri,2025-01-27 This book highlights the applications of stochastic differential equations in white noise probability space to chemical reactions that occur in biology These reactions operate in fluctuating environments and are often coupled with each other The theory of stochastic differential equations based on white noise analysis provides a physically meaningful modelling framework The Wick product based calculus for stochastic variables is similar to regular calculus therefore there is no need for Ito calculus Numerical examples are provided with novel ways to solve the equations While the theory of white noise analysis is well developed by mathematicians over the past decades applications in biophysics do not exist This book provides a bridge between this kind of mathematics and biophysics

An Introduction to Non-Perturbative Foundations of Quantum Field Theory Franco Strocchi,2013-02-15 Quantum Field Theory QFT has proved

to be the most useful strategy for the description of elementary particle interactions and as such is regarded as a fundamental part of modern theoretical physics. In most presentations the emphasis is on the effectiveness of the theory in producing experimentally testable predictions which at present essentially means Perturbative QFT. However, after more than fifty years of QFT we still are in the embarrassing situation of not knowing a single non-trivial even non-realistic model of QFT in 3+1 dimensions allowing a non-perturbative control. As a reaction to these consistency problems one may take the position that they are related to our ignorance of the physics of small distances and that QFT is only an effective theory so that radically new ideas are needed for a consistent quantum theory of relativistic interactions in 3+1 dimensions. The book starts by discussing the conflict between locality or hyperbolicity and positivity of the energy for relativistic wave equations which marks the origin of quantum field theory and the mathematical problems of the perturbative expansion: canonical quantization, interaction picture, non-Fock representation, asymptotic convergence of the series, etc. The general physical principles of positivity of the energy, Poincaré covariance and locality provide a substitute for canonical quantization, qualify the non-perturbative foundation and lead to very relevant results like the Spin-statistics theorem, TCP symmetry, a substitute for canonical quantization, non-canonical behaviour, the euclidean formulation at the basis of the functional integral approach, the non-perturbative definition of the S-matrix, LSZ, Haag-Ruelle, Buchholz theory. A characteristic feature of gauge field theories is Gauss law constraint. It is responsible for the conflict between locality of the charged fields and positivity; it yields the superselection of the unbroken gauge charges, provides a non-perturbative explanation of the Higgs mechanism in the local gauges, implies the infraparticle structure of the charged particles in QED and the breaking of the Lorentz group in the charged sectors. A non-perturbative proof of the Higgs mechanism is discussed in the Coulomb gauge; the vector bosons corresponding to the broken generators are massive and their two-point function dominates the Goldstone spectrum, thus excluding the occurrence of massless Goldstone bosons. The solution of the U(1) problem in QCD, the θ -vacuum structure and the inevitable breaking of the chiral symmetry in each θ -sector are derived solely from the topology of the gauge group without relying on the semiclassical instanton approximation.

For dealing with substances not separately listed, a chapter is included setting out the usual methods for purifying specific classes of compounds. Features empirical formulae inserted for every entry. References all important applications of each substance. Updates and confirms the accuracy of all CAS registry numbers, molecular weights, original reference and physical data. Provides increased coverage of the latest commercial chemical products including pharmaceutical chemicals, updated safety and hazard material and expanded coverage of laboratory and work practices and purification methods. **New National**
