Quantitative Assessment and Validation of Network Inference Methods in Bioinformatics Benjamin Haiibe-Kains, Frank Emmert-Streib, 2015-04-14 Scientists today have access to an unprecedented arsenal of high tech tools that can be used to thoroughly characterize biological systems of interest High throughput omics technologies enable to generate enormous quantities of data at the DNA RNA epigenetic and proteomic levels One of the major challenges of the post genomic era is to extract functional information by integrating such heterogeneous high throughput genomic data This is not a trivial task as we are increasingly coming to understand that it is not individual genes but rather biological pathways and networks that drive an organism's response to environmental factors and the development of its particular phenotype In order to fully understand the way in which these networks interact or fail to do so in specific states disease for instance we must learn both the structure of the underlying networks and the rules that govern their behavior In recent years there has been an increasing interest in methods that aim to infer biological networks These methods enable the opportunity for better understanding the interactions between genomic features and the overall structure and behavior of the underlying networks So far such network models have been mainly used to identify and validate new interactions between genes of interest But ultimately one could use these networks to predict large scale effects of perturbations such as treatment by multiple targeted drugs However currently we are still at an early stage of comprehending methods and approaches providing a robust statistical framework to quantitatively assess the quality of network inference and its predictive potential The scope of this Research Topic in Bioinformatics and Computational Biology aims at addressing these issues by investigating the various complementary approaches to quantify the quality of network models These validation techniques could focus on assessing quality of specific interactions global and local structures and predictive ability of network models These methods could rely exclusively on in silico evaluation procedures or they could be coupled with novel experimental designs to generate the biological data necessary to properly validate inferred networks

Ocean Exchange and Circulation Miroslav Gacic, Manuel Bensi, 2020-12-10 The reduction of greenhouse gas emissions particularly from fossil fuel powered vehicles and airplanes by means of weight savings and leaner fuel consumption helps to restrain environmental impacts In general for a variety of industries and specifically in the case of transport where both weight savings and increased energy efficiency are pursued the use of metal polymer multi material structures has been growing at an increasing and particularly fast pace in recent years Several manufacturing techniques have been or are being developed with the aim of being used for producing dissimilar materials in cost efficient manners This book presents recent developments in the state of the art of advanced additive manufacturing and the joining of metal polymer multi material structures in transportation This publication mainly focuses on the correlations between microstructure manufacturing process i.e. AddJoining adhesive bonding friction riveting friction based staking and friction spot joining properties and the mechanical performance of metal polymer multi material
