Population Ecology John H. Vandermeer, Deborah E. Goldberg, 2013-08-25 The essential introduction to population ecology now expanded and fully updated Ecology is capturing the popular imagination like never before with issues such as climate change species extinctions and habitat destruction becoming ever more prominent At the same time the science of ecology has advanced dramatically growing in mathematical and theoretical sophistication Here two leading experts present the fundamental quantitative principles of ecology in an accessible yet rigorous way introducing students to the most basic of all ecological subjects the structure and dynamics of populations John Vandermeer and Deborah Goldberg show that populations are more than simply collections of individuals Complex variables such as distribution and territory for expanding groups come into play when mathematical models are applied Vandermeer and Goldberg build these models from the ground up from first principles using a broad range of empirical examples from animals and viruses to plants and humans They address a host of exciting topics along the way including age structured populations spatially distributed populations and metapopulations This second edition of Population Ecology is fully updated and expanded with additional exercises in virtually every chapter making it the most up to date and comprehensive textbook of its kind Provides an accessible mathematical foundation for the latest advances in ecology Features numerous exercises and examples throughout Introduces students to the key literature in the field The essential textbook for advanced undergraduates and graduate students An online illustration package is available to professors

Insect Population Ecology George Copley Varley, G. R. Gradwell, Michael Patrick Hassell, 1974-01-01 Expressing population changes density dependent processes affecting communities of single species compositions between species for a limited resource parasites and predators climate and weather life tables and their use in population changes of some forest insects biological control

Stochastic Population Dynamics in Ecology and Conservation Russell Lande, Steinar Engen, Bernt-Erik Sæther, 2003 All populations fluctuate stochastically creating a risk of extinction that does not exist in deterministic models with fundamental consequences for both pure and applied ecology This book provides the most comprehensive introduction to stochastic population dynamics combining classical background material with a variety of modern approaches including new and previously unpublished results by the authors illustrated with examples from bird and mammal populations and insect communities Demographic and environmental stochasticity are introduced with statistical methods for estimating them from field data The long run growth rate of a population is explained and extended to include age structure with both demographic and environmental stochasticity Diffusion approximations facilitate the analysis of extinction dynamics and the duration of the final decline Methods are developed for estimating delayed density dependence from population time series using life history data Metapopulation viability and the spatial scale of population fluctuations and extinction risk are analyzed Stochastic dynamics and statistical uncertainty in population parameters are incorporated in Population Viability Analysis and strategies for

sustainable harvesting Statistics of species diversity measures and species abundance distributions are described with implications for rapid assessments of biodiversity and methods are developed for partitioning species diversity into additive components Analysis of the stochastic dynamics of a tropical butterfly community in space and time indicates that most of the variance in the species abundance distribution is due to ecological heterogeneity among species so that real communities are far from neutral

Ecology David T. Krohne, 2018 Ecology Evolution Application Integration Second Edition takes a unique evolutionary approach to ecology focusing on the concepts of the discipline and the human impact on ecosystems Helping students develop their scientific reasoning skills this text teaches them not only what we know about the field but how we know it

Population and Community Ecology of Ontogenetic Development André M. de Roos, Lennart Persson, 2013-01-15 Most organisms show substantial changes in size or morphology after they become independent of their parents and have to find their own food Furthermore the rate at which these changes occur generally depends on the amount of food they ingest In this book Andr de Roos and Lennart Persson advance a synthetic and individual based theory of the effects of this plastic ontogenetic development on the dynamics of populations and communities De Roos and Persson show how the effects of ontogenetic development on ecological dynamics critically depend on the efficiency with which differently sized individuals convert food into new biomass Differences in this efficiency or ontogenetic asymmetry lead to bottlenecks in and thus population regulation by either maturation or reproduction De Roos and Persson investigate the community consequences of these bottlenecks for trophic configurations that vary in the number and type of interacting species and in the degree of ontogenetic niche shifts exhibited by their individuals They also demonstrate how insights into the effects of maturation and reproduction limitation on community equilibrium carry over to the dynamics of size structured populations and give rise to different types of cohort driven cycles Featuring numerous examples and tests of modeling predictions this book provides a pioneering and extensive theoretical and empirical treatment of the ecology of ontogenetic growth and development in organisms emphasizing the importance of an individual based perspective for understanding population and community dynamics

Integrative Ecology Marc Salomon, 2025-09-26 Ecology is traditionally presented as a science explaining a highly diverse range of subjects for example the biogeochemical cycle of oxygen or the structure of species communities We also tend to incorporate into ecology environmental degradation inflicted by human activities directly or indirectly upon natural systems and the attempts to prevent or mitigate these destructive trends While fundamental ecology is a broad scientific discipline dealing with ecosystems through a diverse number of approaches applied ecology is more a philosophy and body of practices with a focus on society and politics Applied ecology uses concepts used in fundamental ecology Although the topics of fundamental ecology appear disconnected it is often felt that they belong to the same field This book will focus predominately on fundamental ecology It comprises different sections arranged in a logical and linear architecture for the reader to follow The chapters though are neatly interlinked to create an explanatory system reflecting the systemic nature of ecology As even distinguished scientists are uncertain about the scientific character of ecology it is important to explain rationally why these subjects are all topics of the same discipline which epistemologically can be proven to be an actual science As such ecology needs to define its scope and meta theory a system of interrelated consistent theories uniting many studies regarded empirically as different fields In this regard this textbook presents an integrative vision of ecology The history of ecology will also be addressed to explain the development of the field of ecology and its relationship to human activities and ways of thinking since prehistorical time until the present In addition the book presents a typology of the interactions within the biocoenoses separating trophic relationships from other types of interactions coevolution competition mineralisation and presents a reflection on the interactions with the abiotic system This book shows that ecology must be viewed as an integrated system to explain the immensely complex reality of ecosystems in the simplest way possible

Ecology Michael Begon, Colin R. Townsend, 2020-11-11 A definitive guide to the depth and breadth of the ecological sciences revised and updated The revised and updated fifth edition of Ecology From Individuals to Ecosystems now in full colour offers students and practitioners a review of the ecological sciences The previous editions of this book earned the authors the prestigious Exceptional Life time Achievement Award of the British Ecological Society the aim for the fifth edition is not only to maintain standards but indeed to enhance its coverage of Ecology In the first edition 34 years ago it seemed acceptable for ecologists to hold a comfortable objective not to say aloof position from which the ecological communities around us were simply material for which we sought a scientific understanding Now we must accept the immediacy of the many environmental problems that threaten us and the responsibility of ecologists to play their full part in addressing these problems This fifth edition addresses this challenge with several chapters devoted entirely to applied topics and examples of how ecological principles have been applied to problems facing us highlighted throughout the remaining nineteen chapters Nonetheless the authors remain wedded to the belief that environmental action can only ever be as sound as the ecological principles on which it is based Hence while trying harder than ever to help improve preparedness for addressing the environmental problems of the years ahead the book remains in its essence an exposition of the science of ecology This new edition incorporates the results from more than a thousand recent studies into a fully up to date text Written for students of ecology researchers and practitioners the fifth edition of Ecology From Individuals to Ecosystems is an essential reference to all aspects of ecology and addresses environmental problems of the future

Predictive Species and Habitat Modeling in Landscape Ecology C. Ashton Drew, Yolanda F. Wiersma, Falk Huettmann, 2010-11-25 Most projects in Landscape Ecology at some point define a species habitat association These models are inherently spatial dealing with landscapes and their configurations Whether coding behavioral rules for dispersal of simulated organisms through simulated landscapes or designing the sampling extent of field surveys and experiments in real

landscapes landscape ecologists must make assumptions about how organisms experience and utilize the landscape These convenient working postulates allow modelers to project the model in time and space yet rarely are they explicitly considered The early years of landscape ecology necessarily focused on the evolution of effective data sources metrics and statistical approaches that could truly capture the spatial and temporal patterns and processes of interest Now that these tools are well established we reflect on the ecological theories that underpin the assumptions commonly made during species distribution modeling and mapping This is crucial for applying models to questions of global sustainability Due to the inherent use of GIS for much of this kind of research and as several authors research involves the production of multicolored map figures there would be an 8 page color insert Additional color figures could be made available through a digital archive or by cost contributions of the chapter authors Where applicable would be relevant chapters GIS data and model code available through a digital archive The practice of data and code sharing is becoming standard in GIS studies is an inherent method of this book and will serve to add additional research value to the book for both academic and practitioner audiences **An**
