R410A some of this information can be used to work on other refrigerants like subcooling superheat and temperature difference The explanations are made in simple terms which allows the reader to gain understanding and knowledge of an air conditioner Remember pressures and temperatures are examples of measurements taken from air conditioners These measurements are pretty close to what you should get on an air conditioner during normal operation measurements that you can use as a guide The refrigerant gas inside the air conditioner does not get wasted it only circulates throughout the system If it does not cool that does not mean that the refrigerant has leaked out it could be something else Production of R22 refrigerant has decline since 2010 meaning that the companies will no longer produce R22 refrigerant in the near future However new refrigerants have come out since then on this book we are going to mention two new refrigerants 407C and 410A these new refrigerants are not a drop in they can only be installed with new air conditioning equipment but some information can be used for other refrigerants *Charts of Pressure, Density, and Temperature Changes at an Abrupt Increase in Cross-sectional Area of Flow of Compressible Air* Upshur T. Joyner, 1945 Summary Equations have been derived for the change in the quantities that define the thermodynamic state of air pressure density and temperature at an abrupt increase in cross sectional area of flow of compressible air Results calculated from these equations are given in a table and are plotted as curves showing the variation of the calculated quantities with the area expansion ration in terms of the initial Mach number as parameter Only the subsonic region of flow is considered
