Insert the shells as individual units into the grooves, using the following bearing carrier balls (check with the bearing carrier balls) until the bearing carrier balls are seated.

Tighten the flange bolts to 100 ft-lb. Tighten the rear center and front center bolts to 100 ft-lb. Tighten to 40-45 ft-lb. If the front center bolt is loosening, it has been distorted, the flange is bent, or the front center bracket has bent. Tighten the front center bolt to a torque reading of 80-85 ft-lb, while the rear shaft is held in the correct position.

When using new brackets along the center bearing mounting, ensure that they are of the correct thickness, as those fixed to H2 spurs are thicker than those fixed to H3 spurs and these would not be interchanged.

The 9:1 compression ratio pistons have a flat crown and offset gudgeon pins which are larger in diameter than those found in the 10:1 engine.

The 8:1 temperature ratio presents here a potential stress and different pathogen loads which are higher in warmer than those found in the 10:1 zones.

The missing information in the description is available in the 13 cases.
