Bioengineering Liver Transplantation Luc J.W. Van der Laan, Bart Spee, Monique M. A. Verstegen, 2019-11-19 The aim of this Special Issue is to review, understand and evaluate new and exciting opportunities from the field on regenerative medicine, biomaterials and stem cell research for the bioengineering of human liver grafts that can be applied for transplantation and personalized treatment of end stage liver disease. The development of culture conditions for long term expansion of LGR5 intestinal stem cells as crypt villus structures demonstrated the feasibility of deriving complex organ like structures in vitro from primary adult tissues including the liver. Moreover, human pluripotent stem cells hPSCs can be applied to generate functionally matured liver and bile duct epithelial cells. In this Special Issue, we welcome reviews and original papers focussing on hepatic cell sources including adult hepatic stem cells, organoids, fetal and induced pluripotent stem cells and primary cells i.e. hepatocytes, cholangiocytes and endothelial cells and how these cells can be applied in tissue engineering strategies to generate implantable and personalized liver grafts. Potential topics include but are not limited to the following: liver tissue engineering, liver regeneration, graft repair, liver stem cells and organoids, bio scaffolds and 3D printing. We invite you to contribute original research papers as well as comprehensive reviews aligned with these themes to advance and improve the actual state of the art in liver bioengineering and providing new opportunities for the imminent medical problem of organ and tissue shortage for transplantation.
