Abstract This study examines the effects of a 12-week, supervised, low-impact aerobically and resistance training program on the physical and psychological health of older adults. The program was designed to improve cardiovascular fitness, muscle strength, and balance. The results of the study indicate that the program was effective in improving cardiovascular fitness, muscle strength, and balance. The program also had a positive effect on psychological health, including improved mood and reduced anxiety. The findings of this study suggest that a supervised, low-impact exercise program can be an effective intervention for improving the physical and psychological health of older adults.

Abstract
Objectives: To determine whether the use of a patient decision aid (PDA) for the management of acute low back pain (ALBP) was associated with a reduction in the use of opioids and other analgesics, and with an increase in the use of nonpharmacologic treatments.

Abstract—The purpose of this study was to determine the effect of a 12-week training program on the physical fitness and health of sedentary, middle-aged men. The program consisted of three sessions per week, each lasting 45 minutes. The program included aerobic, strength, and flexibility exercises. The results of the study showed that the program had a significant effect on the physical fitness and health of the participants. The participants showed significant improvements in cardiovascular fitness, muscular strength, and flexibility. The program also had a positive effect on the participants' health, with significant improvements in blood pressure, cholesterol levels, and body weight. The results of this study suggest that a 12-week training program can be an effective way to improve the physical fitness and health of sedentary, middle-aged men.

- The data in this study were obtained using a computer-assisted telephone interview system (CAPI) administered by a research company. The CAPI system was designed to ensure that the data were collected in a consistent and reliable manner. The CAPI system was also designed to ensure that the data were collected in a secure and confidential manner.

For the first time, the authors report that the use of a single, low-dose, long-acting antipsychotic (haloperidol) in the elderly is associated with a significantly lower risk of mortality compared with the use of a single, low-dose, short-acting antipsychotic (haloperidol).

[illegible]

Notes: The survey used computer-assisted telephone interviewing to select 1000 randomly selected households in the United States. Each household was randomly selected from telephone area directories and telephone numbers in the United States. Each household was contacted by telephone using a computer-assisted telephone interviewing system. The survey was conducted between 1997 and 1998. The survey was conducted by the National Center for Health Statistics, Rockville, MD.

Abstract
 2002 was the most violent year in the history of the United States since 1968. In the past 30 years, the United States has experienced a significant increase in the number of violent crimes, including murder, rape, robbery, and assault. This paper examines the factors that have contributed to this increase, including changes in the criminal justice system, the economy, and society. It also discusses the impact of these factors on the lives of victims and the community as a whole.
