CONTROL VALVE - AUXILIARY SPOOL SHIFTED

Auxiliary Control Operation

Hand Controls

When the right control handle is pivoted down, it will shift the control valve spool in, supplying oil to the male quick coupler. When the right control handle is pivoted up, it will shift the control valve spool out, supplying oil to the female quick coupler.

Foot Control

When the toe of the control pedal is pushed down, it will shift the control valve spool in, supplying oil to the male quick coupler. When the heel of the control pedal is pushed down, it will shift the control valve spool out, supplying oil to the female quick coupler.

1. Oil flows from the gear pump, 1, through pressure line, 2, to control valve, 3.
2. When the auxiliary valve spool, 4, is pulled out, the oil flows from the rear work port, 5, and supplies oil to the female quick coupler, 6, at the front of the boom.

3. When the auxiliary valve spool, 4, is pushed in, the oil flows from the front work port, 7, and supplies oil to the male quick coupler, 8, at the front of the boom.
4. When the auxiliary circuit is operated to maximum pressure, the main system relief valve will relieve the high pressure oil into the return oil galley in the control valve, returning the oil to the reservoir.
5. The return oil from the opposite quick coupler being pressured will return through the control valve to the reservoir.

NOTE: The return oil from the quick couplers must be returned through the normal return line, 9, to replenish the hydrostatic system: hydrostatic charge oil is required for lubrication of the hydrostatic pumps and motors.

6. When the auxiliary valve spool, 4, is pushed in all the way, it will put the spool into detent position, holding the spool for continuous oil flow to the male quick coupler.
