THE DIVING BELL SPIDER (WATER SPIDER)

Diving bell spiders are the only spider that can live underwater. Also known as a water spider, an air bubble helps the diving bell to survive underwater.

Physical Characteristics

A diving bell spider usually measures between 0.3 and 0.7 inches long. They are brown, black, or gray in color. The diving bell has tiny hairs on its body. Their hairs trap air which then forms a bubble around the diving bell's abdomen.

Creating the Bell

Diving bell spiders start by spinning a curved web. The web attaches to an underwater plant. By using hairs on its body and hind legs, the diving bell traps air near the surface of the water. It brings the air bubble back to the web and releases the air bubble into the web. The air bubble will now be used to help the spider breathe underwater. The spider creates the bubble big enough so that it can fit inside.

Location

Diving bells generally live in Europe and Asia. They tend to stay in calm water such as ponds and marshes. They can also be found in shallow lakes. A diving bell will use plants to form its web.

Living Inside the Bell

A diving bell spider spends most of its life inside its bell. If its bell begins to shrink, it will trap more air bubbles to bring to the bell to make it larger. They will also hunt insects to bring inside its bell to eat. A male diving bell spider will travel outside of the bell to hunt for its prey. However, a female will wait for her prey to come to her. During cold winters, diving bell spiders hibernate. They build strong bells that will provide enough oxygen for the cold winter months.
