¹Basavarajappa, ²D. Venkatesan, and ³M. Vidya

The present study is an attempt to revalidate and develop normative data on a non-verbal test of intelligence-Seguin Form Board (SFB). The SFB was administered on a sample of 720 children including 361 boys and 359 girls between age group of 36-120 months (Mean Age: 89.19 months; SD: 20.82) drawn from rural and urban areas and belonging to different social economic status groups. Results indicate that SFB continues to remain a valid and reliable speed test of intelligence at lower age levels of children. However, there is need to evolve separate norms on SFB for different age groups, socio-economic status levels, and area of residence (rural and urban) respectively. An attempt is also made in this study to demonstrate a modified procedure of test performance as relatively more appropriate, superior and effective for estimation of mental ages/IQ of children on this test.

Keywords: Seguin Form Board, normative data, Indian norms, chronological age, mental age, modified administration

Prior to Itard's (1932) pioneering work, attempts were made to assess the intellectual (non-verbal) abilities of children who could not or would not speak more directly. Seguin (1856) developed a simple but a unique testing method using form boards for assessment of intellectual abilities in children through non-verbal means. The instrument and its many derivatives have become widely used and are well known universally as Seguin Form Board (SFB) (Du Bois, 1970). Stanford-Binet Intelligence Scale includes a Seguin-like form board, a merger of efforts by Binet, Simon and Seguin -the three pioneers in the field of intelligence test development. Since early 1900s, non-verbal intelligence testing has developed methods for assessing cognitive functioning of children who could not or would not speak. The SFB was basically constructed as teaching aid under 'Physiological Method' for children with mental retardation (Seguin, 1866). Later, it was used to assess general intelligence of children in pre-primary and primary school years (Spearman, 1927); or for measuring visual discrimination and matching, eye-hand coordination and cognitive-perceptual abilities

in children (David & Virginia, 1972). Wallin (1916) regards the SFB as a most useful device to test form perception, movement and intelligence-that is, psycho-motor development. Form Board tests were also used for measurement of ability to manipulate concrete material in contrast to verbal/abstract ability. Wallin (1916) observed that the performance (speed) on form board increases with chronological and mental age-more rapidly in early years. He suggested that tests are of little value diagnostically unless periodically fortified with reliable age norms. According to David and Virginia (1972), analysis of SFB test has shown that vector loadings for the test to differ among age levels, indicating that the test may be measuring different abilities at different age levels.

There have been efforts to develop Indian norms for SFB from time to time. In a survey on Mumbai school children (N= 378) within a limited age range (6-8 years), the speed of performance was found to be slower than their Western counterparts (Ramachandran, Deshpande, Apte, .. Shukla, and Shah, (1968). Around the same time, Bharatraj (1971) improved on the sample

Howieson, Erin D. Bigler, Daniel Tranel, 2012-03-27 Now in its Fifth Edition *Neuropsychological Assessment* reviews the major neurobehavioral disorders associated with brain dysfunction and injury This is the 35th anniversary of the landmark first edition As with previous editions this edition provides a comprehensive coverage of the field of adult clinical neuropsychology in a single source By virtue of the authors clinical and research specializations this book provides a broad based and in depth coverage of current neuroscience research and clinical neuropsychology practice While the new edition is updated to include new features and topics it remains true to the highly regarded previous editions Methods for obtaining optimum data are given in the form of hypothesis testing techniques clinical tips and clinical examples In the seven years since the previous edition many advancements have been made in techniques for examining brain function and in our knowledge about brain behavior relationships For example a surge of functional imaging data has emerged and new structural imaging techniques have provided exquisite detail about brain structure For the first time this edition includes examples of these advancements many in stunning color This edition also includes new tools for clinicians such as a neuroimaging primer and a comparison table of the neuropsychological features of progressive dementias The chapters on assessment procedures include discussion of issues related to test selection and reviews of recently published as well as older test batteries used in general neuropsychological assessment plus newly developed batteries for specific issues **Neuropsychology** Gerald Goldstein, Paul David Nussbaum, Sue R. Beers, 2013-06-29 In this volume of the series *Human Brain Function Assessment and Rehabilitation* we cover the area of how brain function is assessed with behavioral or neuropsychological instruments These assessments are typically conducted by clinical neuropsychologists or behavioral neurologists and so we made an effort to present the somewhat differing approaches to these two related disciplines Clinical neuropsychologists are psychologists

who typically utilize standardized tests while behavioral neurologists are physicians who generally assess brain function as part of the clinical neurological evaluation Both approaches have much to offer The basic assumption of neuropsychological assessment is that the brain is the organ of behavior and therefore the condition of the brain may be evaluated with behavioral measures Neuropsychological tests are those measures found by research to be particularly sensitive to alterations in brain function An adequate neuropsychological test is a procedure that can be related to some objective measure of alteration in brain function Over the years these objective measures have changed but generally involve documentation through direct observation of brain tissue or through histological pathological neuroimaging or other laboratory procedures The methods described in the first two volumes of this series describe the neuroimaging procedures that are often used in the validation of neuropsychological tests

Sex Roles of Children in Contemporary Indian Society
Sushila Srivastava, 1990 India has witnessed profound changes in almost every aspect of life The process of industrialization urbanisation and secularization have brought about socio psychological changes in the attitudes and values of people of this country especially among the urban population One of the changes is breaking down of traditional sex role differentiations resulting in an increased flexibility in the roles and activities considered permissible for each sex especially for girls and women Yet being still typically a traditional society the effect of these secular changes is unknown or remains a guess In this book the author attempts to answer the question as to how far these changes have affected the sex role behaviour of the Indian children The exhaustive review of empirical studies on sex roles is useful for those who wish to have a consolidated account of researches on sex roles carried out till now This book will be useful for parents teachers educators and students of Home Science Psychology Sociology and Anthropology
