Kriven, Jingyang Wang, Yanchun Zhou, Dongming Zhu, Gustavo Costa, 2017-01-31 This issue contains 27 papers from The American Ceramic Society's 40th International Conference on Advanced Ceramics and Composites held in Daytona Beach Florida January 24 29 2016 This issue includes papers presented in the following Symposia and Focused Sessions Symposium 2 Advanced Ceramic Coatings for Structural Environmental and Functional Applications Symposium 10 Virtual Materials Computational Design and Ceramic Genome Symposium 11 Advanced Materials and Innovative Processing Ideas for the Industrial Root Technology Symposium 12 Materials for Extreme Environments Ultrahigh Temperature Ceramics and Emerging Technologies Symposium Carbon Nanostructures and Focused Session 1 Geopolymers and Chemically Bonded Ceramics *Biodegradation of Plastics* Zhanyong Wang, Fan Li, Amer Ali Shah, Ken'ichiro

Matsumoto, Martin Koller, 2023-11-21 The consumption of plastic products has increased significantly with the rapid development of the global economy The total output of virgin plastics has already reached eight billion tons and the annual global plastic consumption has reached 2 8 billion tons In parallel with this high consumption rate a staggering amount of plastic waste is generated annually As a consequence of incorrect disposal of waste plastics and plastic longevity this plastic

waste is accumulating in the environment at an increasing rate Moreover since most plastic waste is corrosion resistant these plastics do not decompose in the natural environment and can cause serious environmental pollution In particular petroleum based synthetic polymers including polyethylene polyvinyl chloride polystyrene polypropylene polyethylene terephthalate and polyurethanes need hundreds of years to completely degrade in the natural environment Moreover although some aliphatic polyesters such as polybutylene succinate polycaprolactone and polylactic acid are considered biodegradable degradation of these plastics occurs only under specific microorganism activity and under specific conditions Sometimes the apparent degradation is initiated by hydrolytic activity and not microorganism or enzymatic activity Large scale synthesis and application of plastics only began after 1950 Hence the time span of plastic exposure in the environment has been too short for the adaptive evolution of natural microorganisms Indeed natural microorganisms showing high specificity for plastics and a high degradation efficiency are extremely scarce Because of the inability of most natural microorganisms to recognize and degrade plastics enzymes that can specifically degrade plastics are also scarce Many of the enzymes which are known have either an unclear mechanism of the action on the polymer a poor affinity for their substrates a low efficiency or enzyme production yield is currently low To address these problems new biotechnology strategies need to be implemented In particular new microorganisms and their enzymes need to be identified and pathways for plastic degradation and molecular modification need to be clarified to enhance the activity and stability of the degrading enzymes The current Research Topic aims to cover the recent and novel research trends in the development of plastics biodegradation including petroleum based plastics and bio based plastics under soil composted microbial and enzymatic conditions The recycling technology of degraded products is also of interest

Polymeric Systems as

Antimicrobial or Antifouling Agents Antonella Piozzi,Iolanda Francolini,2020-05-22 The rapid increase in the emergence of antibiotic resistant bacterial strains combined with a dwindling rate of discovery of novel antibiotic molecules has created an alarming issue worldwide Although the occurrence of resistance in microbes is a natural process the overuse of antibiotics is known to increase the rate of resistance evolution Under antibiotic treatment susceptible bacteria inevitably die while resistant microorganisms proliferate under reduced competition Therefore the out of control use of antibiotics eliminates drug susceptible species that would naturally limit the expansion of resistant species In addition the ability of many microbial species to grow as a biofilm has further complicated the treatment of infections with conventional antibiotics A number of corrective measures are currently being explored to reverse or slow antibiotic resistance evolution Among which one of the most promising solutions is the development of polymer based antimicrobial compounds In this Special Issue different polymer systems able to prevent or treat biofilm formation including cationic polymers antibacterial peptide mimetic polymers polymers or composites able to load and release bioactive molecules and antifouling polymers able to repel microbes by physical or chemical mechanisms are reported Their applications in the design and fabrication of medical devices in food packaging and as drug carriers is investigated [11th International Conference on Materials Science \(ICMS\)](#)
