

STRUCTURE AND FUNCTIONS OF NEURONS

Introduction:

Every organ and muscle in your body is in communication with your nervous system. Like all other living tissue, the nervous system is made up of cells, the most important of which are the neurons (or nerve cells). Each of the 80–90 billion neurons in the adult human brain is a tiny, discrete information-processing unit, receiving inputs from other cells, integrating those inputs, and then distributing the processed information to other neurons. Arranged in networks that vary enormously in complexity, circuits of neurons define and control all of our abilities and behaviors, from the simplest reflexes to the most complex intellectual processes. Neurons are responsible for carrying information throughout the human body. Using electrical and chemical signals, they help coordinate all of the necessary functions of life. In this article, we explain what neurons are and how they work. Neurons can only be seen using a microscope.

STRUCTURE OF NEURON

Parts of a neuron:

Neurons vary in size, shape, and structure depending on their role and location. However, nearly all neurons have three main essential parts and also have some other parts. These are as follows.

Main Parts:

1. Cell body

Also known as a soma, the cell body is the neuron's core. The cell body carries genetic information, maintains the neuron's structure, and provides energy to drive activities. Like other cell bodies, a neuron's soma contains a **nucleus** and specialized organelles. It's enclosed by a membrane which both protects it and allows it to interact with its immediate surroundings.
