

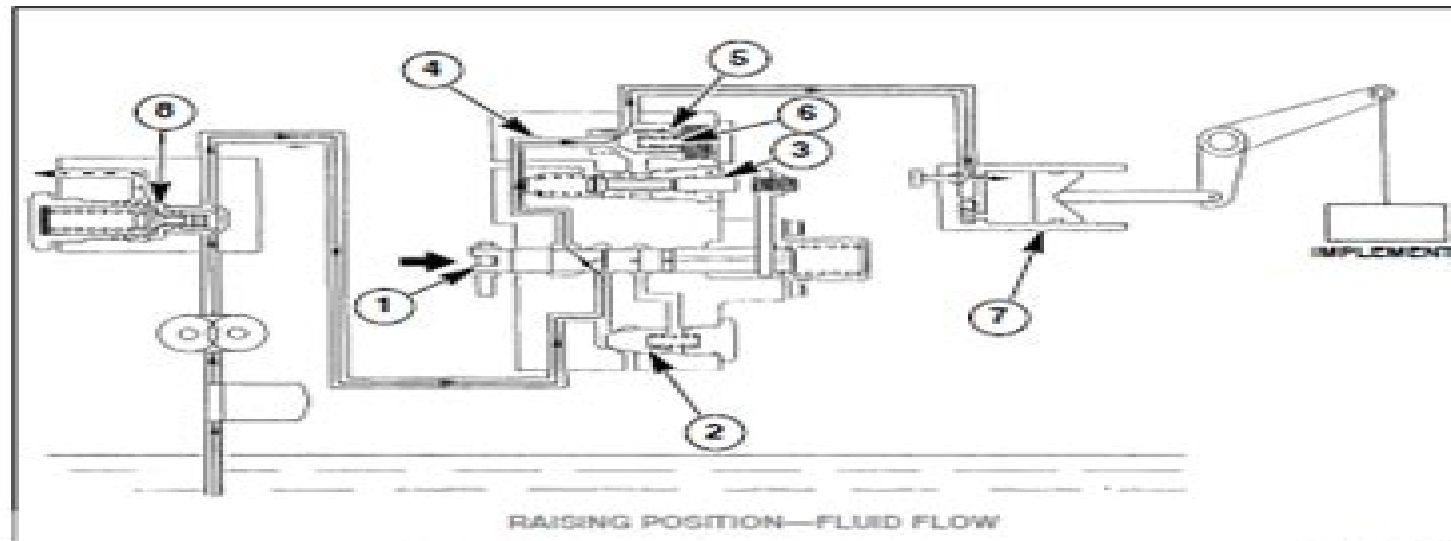

Figure 8-10

RAISING POSITION—FLUID FLOW

When the position control lever is moved to the raise position, the control valve spool, 1, is moved inward (rearward). The fluid passages in the control valve are opened, and fluid flows to the check valve, 5, through the check valve fluid passage, 4.

Fluid pressure against the check valve overcomes the check valve spring, 6, and the lift cylinder fluid static pressure on the check valve. This raises the check valve off its seat, allowing

fluid to flow to the lift cylinder, 7, to raise the implement. When the fluid pressure exceeds 2135 psi (150 bar), the relief valve, 6, opens and fluid is returned to the sump.

A high pressure safety valve in the lift cylinder head protects against shock loads by opening at pressures exceeding 250 +/- 20 bars (3625 +/- 290 psi), returning fluid to sump.

Programming C. Romero,2014-06-28 Goal Programming GP is perhaps the oldest and most widely used approach within the Multiple Criteria Decision Making MCDM paradigm GP combines the logic of optimisation in mathematical programming with the decision maker s desire to satisfy several goals The primary purpose of this book is to identify the critical issues in

GP and to demonstrate different procedures capable of avoiding or mitigating the inherent pitfalls associated with these issues. The outcome of a search of the literature shows many instances where GP models produced misleading or even erroneous results simply because of a careless formulation of the problem. Rather than being in itself a textbook, *Critical Issues in Goal Programming* is designed to complement existing textbooks. It will be useful to students and researchers with a basic knowledge of GP as well as to those interested in building GP models which analyse real decision problems.
