OCEAN ACIDIFICATION

- As carbon dioxide (CO_2) dissolves in sea water, it forms carbonic acid, decreasing the ocean's pH, a process collectively known as ocean acidification.
- Present ocean acidification occurs approximately ten times faster than anything experienced during the last 300 million years, jeopardising the ability of ocean systems to adapt to changes in ocean chemistry due to CO_2 .
- Ocean acidification has the potential to change marine ecosystems and impact many ocean-related benefits to society such as coastal protection or provision of food and income.
- Increased ocean temperatures and oxygen loss act concurrently with ocean acidification and constitute the 'deadly trio' of climate change pressures on the marine environment.
- To combat the worst effects of the deadly trio, CO_2 emissions need to be cut significantly and immediately at the source.
- Sustainable management, conservation, restoration and strong, permanent protection of at least 30% of the ocean are urgently needed.

What is the issue?

Ocean acidification is a direct consequence of increased human-induced carbon dioxide (CO_2) concentrations in the atmosphere. The ocean absorbs over 25% of all anthropogenic emissions from the atmosphere each year. As CO_2 dissolves in sea water it forms carbonic acid, thereby decreasing the ocean's pH, leading to a suite of changes collectively known as ocean acidification. Ocean acidification is happening in parallel with other climate-related stressors, including ocean warming and deoxygenation. This completes the set of climate change pressures on the marine environment – heat, acidity and oxygen loss – often referred to as the 'deadly trio'. Interaction between these stressors is often cumulative or even multiplicative, resulting in combined effects that are more severe than the sum of their individual impacts.

Why is this important?

Present ocean acidity change is unprecedented in magnitude, occurring at a rate approximately ten times faster than anything experienced during the last 300 million years. This rapid timeline is jeopardising the ability of ocean systems to adapt to changes in CO_2 – a process that naturally occurs over millennia. Changes in ocean pH levels will persist as long as concentrations of atmospheric CO_2 continue to rise. To avoid significant harm, atmospheric concentrations of CO_2 need to get back to at least the 320-350 ppm range of CO_2 in the atmosphere.

Compared to other similar events in Earth's history, ocean acidification, over hundreds of years, has been happening very fast. However, its recovery has been

very slow due to the inherent time lags in the carbon and ocean cycles.

Oceans are acidifying fast

From: Latifley, D. d'A. and Baxter, J.M. (eds) (2010) Ocean Acidification: Questions Answered.

Ocean acidification has the potential to change marine ecosystems and impact many ocean-related benefits to society such as coastal protection or provision of food and income. Although more knowledge on the impacts of ocean acidification on marine life is needed, changes in many ecosystems and the services they provide to society can be extrapolated from current understanding. Some of the strongest evidence of the potential effects of ocean acidification on marine ecosystems stems from experiments on calcifying organisms.

Increased sea water acidity has been demonstrated to affect the formation and dissolution of calcium carbonate shells and skeletons in a range of marine species, including corals, molluscs such as oysters and mussels, and many phytoplankton and zooplankton species that form the base of marine food webs.

Changes in species growth and reproduction, as well as structural and functional alterations in ecosystems, will threaten food security, harm

Ocean Acidification Research Paper:

The Federal Ocean Acidification Research and Monitoring Act United States. Congress. House. Committee on Science and Technology (2007). Subcommittee on Energy and Environment, 2008

Review of the Federal Ocean Acidification Research and Monitoring Plan National Research Council, Division on Earth and Life Studies, Ocean Studies Board, Committee on the Review of the National Ocean Acidification Research and Monitoring Plan, 2013-06-03 The world's ocean has already experienced a 30% rise in acidity since the industrial revolution with acidity expected to rise 100 to 150% over preindustrial levels by the end of this century Potential consequences to marine life and also to economic activities that depend on a healthy marine ecosystem are difficult to assess and predict but potentially devastating To address this knowledge gap Congress passed the Federal Ocean Acidification Research and Monitoring FOARAM Act in 2009 which among other things required that an interagency working group create a Strategic Plan for Federal Research and Monitoring of Ocean Acidification Review of the Federal Ocean Acidification Research and Monitoring Plan reviews the strategic plan on the basis of how well it fulfills program elements laid out in the FOARAM Act and follows the advice provided to the working group in the NRC's 2010 report Ocean Acidification A National Strategy to Meet the Challenges of a Changing Ocean This report concludes that overall the plan is strong and provides a comprehensive framework for improving our understanding of ocean acidification Potential improvements include a better defined strategy for implementing program goals stronger integration of the seven broad scientific themes laid out in the FOARAM Act and better mechanisms for coordination among federal agencies and with other U.S. and international efforts to address ocean acidification

Ocean Acidification Jean-Pierre Gattuso, Lina Hansson, 2011-09-15 The ocean helps moderate climate change thanks to its considerable capacity to store CO₂ through the combined actions of ocean physics chemistry and biology This storage capacity limits the amount of human released CO₂ remaining in the atmosphere As CO₂ reacts with seawater it generates dramatic changes in carbonate chemistry including decreases in pH and carbonate ions and an increase in bicarbonate ions The consequences of this overall process known as ocean acidification are raising concerns for the biological ecological and biogeochemical health of the world's oceans as well as for the potential societal implications This research level text is the first to synthesize the very latest understanding of the consequences of ocean acidification with the intention of informing both future research agendas and marine management policy A prestigious list of authors has been assembled among them the coordinators of major national and international projects on ocean acidification

Review of the Federal Ocean Acidification Research and Monitoring Plan National Research Council, Division on Earth and Life Studies, Ocean Studies Board, Committee on the Review of the National Ocean Acidification Research and Monitoring Plan, 2013-07-03 The world's ocean has already experienced a 30% rise in acidity since the industrial revolution with acidity expected to rise 100 to 150% over preindustrial levels by the end of this century Potential consequences to marine life and also to economic activities that depend on a

healthy marine ecosystem are difficult to assess and predict but potentially devastating To address this knowledge gap Congress passed the Federal Ocean Acidification Research and Monitoring FOARAM Act in 2009 which among other things required that an interagency working group create a Strategic Plan for Federal Research and Monitoring of Ocean Acidification Review of the Federal Ocean Acidification Research and Monitoring Plan reviews the strategic plan on the basis of how well it fulfills program elements laid out in the FOARAM Act and follows the advice provided to the working group in the NRC's 2010 report Ocean Acidification A National Strategy to Meet the Challenges of a Changing Ocean This report concludes that overall the plan is strong and provides a comprehensive framework for improving our understanding of ocean acidification Potential improvements include a better defined strategy for implementing program goals stronger integration of the seven broad scientific themes laid out in the FOARAM Act and better mechanisms for coordination among federal agencies and with other U S and international efforts to address ocean acidification

Reflecting on our Changing Climate, from Fear to Facts Constantin Cranganu, 2024-03-07 This book contains reflections about climate change an intrinsic reality of our planet's history over the past 4.6 billion years including both natural and anthropogenic variations More recently the phrase climate change has become a euphemism for carbon dioxide emissions While focusing on CO₂ emissions is crucial for understanding climate change solely using this term in scientific discussions may lead to overlooking other complex factors contributing among other things to extreme weather events potentially affecting the quality of evidence analysis The shift towards using climate change interchangeably with carbon dioxide emissions within scientific circles while highlighting a key driver necessitates ensuring comprehensive discussions that encompass the diverse evidence related to all climate sub systems Therefore using the phrase like a changing climate opens a bigger umbrella that facilitates covering multiple and complex climate manifestations The book will be useful to students researchers and policy makers working and studying in the vast and often contentious landscape of climate change debates

Ocean Acidification National Research Council, Division on Earth and Life Studies, 2012-07-29 Over recent years human activities such as the burning of fossil fuels have increased the amount of carbon dioxide gas emitted to the atmosphere and the amount that dissolves into the ocean Now so much carbon dioxide has been absorbed by the ocean that the chemistry of seawater is changing causing the ocean to become more acidic Based on a National Research Council report this booklet describes the well understood chemistry of ocean acidification and explores the many questions that remain How will ocean acidification impact marine life such as fish corals and shellfish How will the effects on individual species scale up to whole ecosystems What will ocean acidification mean for aquaculture the fishing industry and coastal tourism

Marine Environmental Epigenetics Jose M. Eirin-Lopez, Hollie Putnam, 2021-07-05 Deep-ocean climate change impacts on habitat, fish and fisheries Food and Agriculture Organization of the United Nations, 2019-03-22 This publication presents the outcome of a meeting between the FAO UNEP ABNJ Deep seas and Biodiversity project and the Deep Ocean Stewardship Initiative It focuses on the impacts of climatic changes on demersal fisheries and the interactions of these fisheries with other species and vulnerable marine ecosystems Regional fisheries management organizations rely on scientific information to develop advice to managers In recent decades climate change has been a focus largely as a unidirectional forcing over decadal timescales However changes can occur abruptly when critical thresholds are crossed Moreover distribution changes are expected as populations shift from existing to new areas Hence there is a need for new monitoring programmes to help scientists understand how these changes affect productivity and biodiversity The principal cause of climate change is rising greenhouse gases and other compounds in the atmosphere that trap heat causing global warming leading to deoxygenation and acidification in the oceans Three dimensional fully coupled earth system models are used to predict the extent of these changes in the deep oceans at 200-2500 m depth Trends in changes are identified in many variables including temperature pH oxygen and supply of particulate organic carbon POC Regional differences are identified indicating the complexity of the predictions The response of various fish and invertebrate species to these changes in the physical environment are analysed using hazard and

suitability modelling Predictions are made to changes in distributions of commercial species though in practice the processes governing population abundance are poorly understood in the deep sea environment and predicted distributional changes are not always as expected and may be manifested as simple disappearance of species or ecosystems The publication underscores the fact adaptive monitoring and management mechanisms must be in place to ensure that fisheries are sustainable and the environment remains healthy and productive Suggestions are provided as to the actions necessary
