

Keystone Species

Saguaro Cactus

What is a keystone species?

A keystone species is a species that has a disproportionately large effect on its environment relative to its abundance. The concept was developed by ecologist Robert Paine in the 1960s, based on his studies of intertidal ecosystems. Paine found that the removal of a single species, the starfish *Pisaster ochaceus*, led to a dramatic change in the community structure of the rocky intertidal zone.

Keystone species are often predators, but they can also be engineers, mutualists, or other types of organisms. For example, the beaver is a keystone engineer because its dam-building activities create a wetland habitat that supports a wide variety of other species. The African elephant is a keystone mutualist because it disperses the seeds of many trees and plants.

Why is the saguaro a keystone species?

The saguaro cactus is a keystone species in the Sonoran Desert because it provides a variety of important ecosystem services. It is a primary food source for many desert animals, including birds, mammals, and reptiles. The saguaro also provides shelter and nesting sites for many species of birds and insects. Additionally, the saguaro plays a role in the desert's water cycle by storing water in its thick, fleshy stems.

How does the saguaro contribute to the desert ecosystem?

The saguaro cactus contributes to the desert ecosystem in several ways:

- It provides food and shelter for many desert animals.
- It plays a role in the desert's water cycle by storing water in its stems.
- It helps to stabilize the soil and prevent erosion.
