another larger organism. The flow of nutrients and energy from one organism to another at different trophic levels forms a food chain.

Plants → Rats → Snakes → Hawks

(ii) The amount of energy transferred from one trophic level to the next is typically around 10% of the energy available at the previous level. This is known as the 10% rule.

Therefore, the amount of energy that will be transferred from organisms of the third trophic level to the organisms of the fourth trophic level can be calculated as follows:

Energy available at the third trophic level = 10% of the energy available at the second trophic level

$$= 0.1 \times 20,000 \text{ J}$$

$$= 2,000 \text{ J}$$

Therefore, 2,000 J of energy will be transferred from the organisms of the third trophic level to the organisms of the fourth trophic level.
