

Neuron Structure

What are the essential structures that make up a neuron?

Why?

Cells are specialized for different functions in multicellular organisms. In animals, one unique kind of cell helps organisms survive by collecting information and sending messages throughout the body. The shapes and features of neurons, which are the primary cells in the nervous system, enable animals to experience all of the five senses; find food, mates, and shelter; and to survive in their diverse environments.

Model 1 – Parts of a Neuron

1. Model 1 is an illustration of two neurons. Label one of the neurons in the diagram with the following structures:

Cell body or soma

Axon

Cell nucleus

Synapse

Dendrites

See Model 1.

2. Which structure(s) on the neuron in Model 1 would receive a signal from either a sensory cell (taste bud, touch receptor, retinal cell) or from another neuron?

The dendrites receive the signal from other cells.

3. Draw an arrow through the two cells in Model 1 to show the path of a nerve impulse if a message was being sent through the two neurons.

See dotted line in Model 1.

Structure-function Correspondence as Revealed by Biological Scaling Theory Paheli Desai-Chowdhry,2023 Neurons are connected by complex branching processes that collectively process information for organisms to respond to their environment Classifying neurons according to differences in structure or function is a fundamental piece of neuroscience Here by constructing new biophysical theory and testing against our empirical measures of branching structure we establish a correspondence between neuron structure and function as mediated by principles such as time or power minimization for information processing as well as spatial constraints for forming connections Based on these principles we use Lagrange multipliers to predict scaling ratios for axon and dendrite sizes across branching levels We test our predictions for radius scale factors against those extracted from images measured for species that range from insects to whales Notably our findings reveal that the branching of axons and peripheral nervous system neurons is mainly determined by time minimization while dendritic branching is mainly determined by power minimization Further comparison of different dendritic cell types reveals that Purkinje cell dendrite branching is constrained by material costs while motoneuron dendrite branching is constrained by conduction time delay We extend this model to incorporate asymmetric branching where there are multiple different paths from the soma to the synapses and thus multiple interpretations of conduction time delay one considers the optimal path and the other considers the sum of all possible paths leading to different predictions We find that the data for motoneurons show a distinction between the asymmetric and symmetric branching junctions corresponding to predictions using different interpretations of the time delay constraint Moreover the more asymmetric branching junctions are localized near the synapses indicating that different functional principles affect the structure at different regions of the cell Finally we use machine learning methods to classify cell types using functionally relevant structural parameters derived from our model Incorporating branching level as a feature in classification in addition to parameters related to information flow improves performance across methods suggesting that information flow drives localized differences in morphology Future directions of this work include estimating specific parameters related to functional tradeoffs and myelination using numerical optimization and analyzing changes across stages of development **Advancing Our Understanding of Structure and Function in the Brain: Developing Novel Approaches for Network Inference and Emergent Phenomena** Chris G. Neuron Structure and Sleep An astonishingly sophisticated organ the human brain is responsible for a plethora of life sustaining processes A network of neurons the basic units responsible for information transmission within the brain is at the core of its activities Neuronal architecture is a key to understanding many cognitive and physiological processes including sleep the most mysterious human experience Building Blocks of Neurons The Brain s Architectural Mysteries A nervous system s principal functional unit is a neuron also called a nerve cell The brain is an enormous network that enables the transmission of impulses at lightning speed it is composed of billions of these complex cells Multiple parts all of which are essential to the neuron s operation make up a normal neuron The cell body often called the soma is the nucleus of the neuron It is home to the cell s genetic material and regulatory center the nucleus It is the job of the cell body to process incoming signals and determine if an electrical impulse should be transmitted The dendrites are the parts of a neuron that extend outward from the cell body and receive impulses sent by neighboring neurons These complex networks enhance the amount of surface area that may be used for synaptic connections which are the building blocks of neuronal communication **The Fine Structure of the Nervous System** Alan Peters, Sanford L. Palay, Henry deF. Webster, 1991 This book represents the most complete and authoritative description on the fine structure of the nervous system available in a single volume Beginning with background material on the neuron the book then examines specific portions of the nerve cell and of the various supporting cells Structure is first described in a general fashion followed by detailed coverage of the fine structure of each component with full discussion of how the structural features relate to their functions Extensively revised and rewritten this book will bring readers up to date with the many important developments that have taken place since publication of the previous edition It includes over 130 electron micrographs and line drawings many of which are new to this edition
