

# Study Guide: Physical and Chemical Oceanography

## Effective composition of seawater is determined by:

- 1) Primary salinity - given amount of dissolved solids with respect to total weight, freshwater composition consists of 96.5% water and 3.5% solids
- 2) Source - water moving through salt balance from atmosphere through evaporation and precipitation, and ice melting/refreezing, resulting in different salinities, densities and chemical composition
- 3) Secondary salinization process - physical/chemical processes, biologically induced changes and biological, mineralization of waste matter for future ocean cycles of time

## Effective salinity and composition on density:

- 1) Temperature - more important, decreases density
- 2) Salinity - increases density, increases temperature, decreases density

## How temperature and salinity produce density, water volume, negative expansion:

### Temperature differences cause water layers:

- 1) warm water rises above cold water, cold water is more dense
- 2) warm, less dense water is floating on a colder, denser water beneath
- 3) where the temperature difference persists, the water remains in contact to be the stratified

### Salinity differences cause water layers:

- 1) water sinks at cold because the density of water increases
- 2) water with higher salinity, and lower density, floats above of water with higher salinity
- 3) density (mass) increased by salinity, the higher density
- 4) the higher salinity water has a higher density, so sinking as the temp increases

## Thrust:

low pressure rise and fall of sea level is related to the rise and fall of the earth

### Gravitational effects:

on the Earth, Moon, stars causing various tides, waves

Barometric pressure - is the pressure in liquid column the water atmosphere

Pressure that affects tidal range - varies with position, depth, time

Local atmospheric tidal range - air pressure distribution throughout time range
