Unit 1 Review

- As a wave travels through a medium, it transports energy but does not transport matter in the direction of the wave.
- Transverse waves are waves in a direction perpendicular to the direction of wave travel. Longitudinal waves travel through a series of compressions and rarefactions.
- Waves can be described by amplitude, wavelength, frequency, period, and speed.
- As a wave travels through a medium, particles are displaced and return to their original position after the wave passes.
- Electromagnetic waves differ from other types of waves because they do not need matter through a medium.
- A wavelength is the distance between two consecutive compressions or rarefactions.
- Given the distance between two consecutive compressions or rarefactions and the time you can measure the wavelength.
- As wavelength is given frequency, you can find the speed of a wave by using speed = wavelength x frequency.
- Sound is traveling through a medium, but a trident displaced particles of matter in the same direction the wave is traveling. This type of wave is a longitudinal wave.
- Because the particles move parallel to the direction of wave travel, it is called longitudinal wave.

Unit 2 Assignment Questions

Question	Answer
What type of waves can only travel through matter as medium?	Answer: Only transverse waves through matter as medium.
What is period?	Period is the time it takes for the wave to repeat.
What is the relationship between amplitude and period?	If the amplitude increases, the period also increases. So, therefore, the period is directly proportional to the amplitude.
How does the type of medium affect a wave?	The wave can be longitudinal or transverse. But, the speed of wave.
Describe the relationship between frequency and wavelength?	The wave has the wavelength, the higher the frequency.
