Cell Boundaries Stephen White, Gunnar von Heijne, Donald Engelman, 2021-12-31 The central themes of Cell Boundaries concern the structural and organizational principles underlying cell membranes and how these principles enable function By building a biological and biophysical foundation for understanding the organization of lipids in bilayers and the folding assembly stability and function of membrane proteins the book aims to broaden the knowledge of bioscience students to include the basic physics and physical chemistry that inform us about membranes In doing so it is hoped that physics students will find familiar territory that will lead them to an interest in biology Our progress toward understanding membranes and membrane proteins depends strongly upon the concerted use of both biology and physics It is important for students to know not only what we know but how we have come to know it so Cell Boundaries endeavours to bring out the history behind the central discoveries especially in the early chapters where the foundation is laid for later chapters Science is far more interesting if as students we can appreciate and share in the adventures and misadventures of discovering new scientific knowledge Cell Boundaries was written with advanced undergraduates and beginning graduate students in the biological and physical sciences in mind though this textbook will likely have appeal to researchers and other academics as well Highlights the history of important central discoveries Early chapters lay the foundation for later chapters to build on so knowledge is amassed High quality line diagrams illustrate key concepts and illuminate molecular mechanisms Box features and spreads expand on topics in main text including histories of discoveries special techniques and applications

Elson, W. Frazier, L. Glaser, 2012-12-06 This volume assembles reviews on topics in two major related areas One of these concerns the interactions of cells with substrata and with other cells which are mediated by the extracellular matrix and soluble molecules As described in this volume these interactions are responsible for controlling cell functions ranging from embryogenesis and neural development to blood clotting More over important properties of the extracellular matrix can be modulated by the interdependent actions of tumor cells and fibroblasts The

other major area of interest concerns the response of cells to extracellular signals Recent work has begun to reveal how a remarkable diversity of cellular functions including neuronal proliferative membrane cytoskeletal and many other kinds of responses are elicited through the mediation of a relatively small and interdependent set of second messenger systems These include both changes in cytoplasmic ionic balances and activation of various kinds of protein kinases Both subjects are covered in this volume The two areas are linked by the common theme of cellular response to an external environment that is sensed through cellular interactions with informational molecules which are soluble agents as well as those that are components of insoluble matrices It is only recently that we have come to appreciate the complex interplay between the matrix surrounding a cell and the cell's response to hormones and growth factors Thus we have tried to select examples in which this type of extracellular integration may play a role

Cell Membrane Transport Arnost Kotyk, 2012-03-19

It is not a particularly rewarding task to engage in writing a book on a subject which is undergoing a rapid and potentially revolutionary development but on the other hand the investigation of transport of substances into and out of cells has reached a stage of maturity or at least of self realization and this fact alone warrants a closer examination of the subject No one will doubt at present that the movement mostly by selective translocation of substances ranging from hydrogen ions to deoxyribonucleic acids across the cell surrounding barriers represents one of the salient features of a living cell and that if we are permitted to go so far the cessation of the selective transport processes might be considered as the equivalent of cell death Hardly anybody will question the premise that cell and tissue differentiation within the ontogenetic development of an organism is closely associated with properties of the outer cell face Perhaps no serious scholar will attempt to refute the concept that membranes with characteristic morphology and composition represent the architectural framework for the whole cell And probably no experienced biologist will raise objections to the belief that many physiological processes like nervous impulse conduction and other electrical phenomena of cells and tissues or their volume changes are associated with membrane regulated shifts of ions and molecules
