Pushing Frontiers - Imaging For Photon Science Jiaguo Zhang, Iain Sedgwick, Cornelia B. Wunderer, 2024-12-24 Developments of cutting edge X ray imaging detectors are largely driven by experiments at the large photon science facilities i e the synchrotron radiation sources and free electron lasers FELs which enable a wealth of investigations in physics material science biology chemistry environmental sciences and beyond The next generation radiation sources namely diffraction limited storage rings DLSR and high repetition rate FELs operated in the continuous wave CW mode not only offer brilliant opportunities for research but also pose new challenges and requirements for the X ray detectors required to exploit them fully Examples include the high count rate capability required at the DLSRs the ultra high continuous frame rate and data throughput at the FELs and a broad photon energy range from tens of eV to hundreds of keV spanned by the facilities In

order to meet the new requirements posed by the most advanced photon science facilities envisioned or already under development around the world today various novel photon detection and imaging concepts are being investigated and detector technologies are advancing fast The goal of this research topic is to address the challenges and discuss the critical problems encountered in imaging systems for photon science including but not limited to sensing materials ASICs readout electronics detector systems and data reduction Moreover it will encompass a discussion of the development strategies technological advances and recent achievements of each subject thereby facilitating the realization of complete concepts for novel imaging systems as well as further developments of individual detector technologies *High-precision EUV and X-ray Optics for Advanced Photon Source Facilities* Qiushi Huang,Hongchang Wang,Ming Li,Hongxin Luo,Xiaohao Dong,2023-02-02 *American Men and Women of Science* ,1982 Interpretable Machine Learning for the Analysis, Design, Assessment, and Informed Decision Making for Civil Infrastructure M. Z. Naser,2023-10-18 The past few years have demonstrated how civil infrastructure continues to experience an unprecedented scale of extreme loading conditions i e hurricanes wildfires and earthquakes Despite recent advancements in various civil engineering disciplines specific to the analysis design and assessment of structures it is unfortunate that it is common nowadays to witness large scale damage in buildings bridges and other infrastructure The analysis design and assessment of infrastructure comprises of a multitude of dimensions spanning a highly complex paradigm across material sciences structural engineering construction and planning among others While traditional methods fall short of adequately accounting for such complexity fortunately computational intelligence presents novel solutions that can effectively tackle growing demands of intense extreme events and modern designs of infrastructure especially in this era where infrastructure is reaching new heights and serving larger populations with high social awareness and expectations Computational Intelligence for Analysis Design and Assessment of Civil Infrastructure highlights the growing trend of fostering the use of CI to realize contemporary smart and safe infrastructure This is an emerging area that has not fully matured yet and hence the book will draw considerable interest and attention In a sense the book presents results of innovative efforts supplemented with case studies from leading researchers that can be used as benchmarks to carryout future experiments and or facilitate development of future experiments and advanced numerical models The book is written with the intention to serve as a guide for a wide audience including senior postgraduate students academic and industrial researchers materials scientists and practicing engineers working in civil structural and mechanical engineering Presents the fundamentals of AI ML and how they can be applied in civil and environmental engineering Shares the latest advances in explainable and interpretable methods for AI ML in the context of civil and environmental engineering Focuses on civil and environmental engineering applications day to day and extreme events and features case studies and examples covering various aspects of applications **Physico-Chemical Control of Cell Function** Cesare Gargioli,Giancarlo Forte,Alberto Rainer,2019-10-17 Extracellular Matrix ECM has been considered for

a long time merely a scaffold sustaining cell and tissue function Despite this simplistic view shared by many nowadays ECM and their mechanic physical and chemical characteristic acquired a progressive larger role actively regulating cell life survival proliferation gene expression and differentiation The interplay between cells and the ECM is continuously controlled at the cell level in a dynamic way While cells synthesize the raw components of the ECM this in turn impacts on cell function by providing chemical topographical and mechanical hints Such stimuli have been proven to control several aspects of cell function including survival proliferation differentiation and migration The molecular pathways activated by cells in response to the physical cues arising from the ECM are being disclosed and thus the possibility to control cell function through materials design is becoming more realistic Current in vitro protocols relying in 2D cell culture system entail reductionist approaches to the complexity of cell ECM interaction and result in cells rapidly losing their distinctive functions in culture Understanding and replicating the 3D microenvironmental cues affecting cell function appears as a mandatory requirement for the development of next generation biomaterials as well as for the establishment of more physiologically relevant and predictive in vitro models of diseases Such an effort will require a multidisciplinary approach at the convergence of biophysics biology nanotechnology and bioengineering
