### Proposed:

We want your input on the principle that we propose to use in a new weighting system.

### Background:

Because of the nature of the data, we have to use a weighting system that is not a simple average. We have to use a weighting system that is not a simple average.

### Proposed:

#### 1. The data is a set of three values:

A, B, and C, where A, B, and C are all positive.

Then we have:

We will calculate the weighted average of A, B, and C, where the weights are the values of A, B, and C.

2. The weighted average of A, B, and C is calculated by taking the values of A, B, and C, multiplying them by the values of A, B, and C, and then adding the results together. The result is the weighted average of A, B, and C.

$$\% \text{ difference} = \frac{\text{actual value} - \text{calculated value}}{\text{actual value}} \times 100\%$$

#### 3. The proposed system for the percent difference is as follows:

4. Using the data, we have provided, we will calculate the percent difference. The data provided gives you the values. Using the calculations of the percent difference, we will calculate the percent difference for the data provided. The data provided gives you the values. Using the calculations of the percent difference, we will calculate the percent difference for the data provided.

5. Calculate the percent difference for the data provided. The data provided gives you the values. Using the calculations of the percent difference, we will calculate the percent difference for the data provided.
