Project description: The project involves the development of a new software application for the management of a company's inventory. The application will be developed using Java and will be deployed on a web server. The project is expected to be completed within a 12-month period.

Figure 1 is a schematic diagram of the experimental setup. It shows a subject seated at a table, looking at a video screen. A camera is positioned above the screen. A target is placed on the table. A light source is positioned to the right of the target. A scale bar is shown below the target.

Interpreting Off-Target Effects

When you have a hypothesis about the mechanism of an off-target effect, you can use the following steps to test it:

1. Identify the off-target effect.
2. Propose a mechanism for the off-target effect.
3. Design experiments to test the mechanism.
4. Perform the experiments and analyze the results.
5. Draw conclusions about the mechanism.

For example, if you observe that a drug causes a decrease in heart rate, you might propose that the drug is acting on the heart's pacemaker cells. To test this hypothesis, you could design experiments to measure the heart rate in the presence and absence of the drug, and in the presence and absence of a pacemaker inhibitor. If the heart rate decreases in the presence of the drug and the pacemaker inhibitor, but not in the absence of either, you would conclude that the drug is acting on the heart's pacemaker cells.

Interpreting On-Target Effects

When you have a hypothesis about the mechanism of an on-target effect, you can use the following steps to test it:

1. Identify the on-target effect.
2. Propose a mechanism for the on-target effect.
3. Design experiments to test the mechanism.
4. Perform the experiments and analyze the results.
5. Draw conclusions about the mechanism.

For example, if you observe that a drug causes an increase in heart rate, you might propose that the drug is acting on the heart's pacemaker cells. To test this hypothesis, you could design experiments to measure the heart rate in the presence and absence of the drug, and in the presence and absence of a pacemaker inhibitor. If the heart rate increases in the presence of the drug and the pacemaker inhibitor, but not in the absence of either, you would conclude that the drug is acting on the heart's pacemaker cells.
