*Computational Subsurface Hydrology* George Yeh, 2000-11-30 Any numerical subsurface model is comprised of three components a theoretical basis to translate our understanding phenomena into partial differential equations and boundary conditions a numerical method to approximate these governing equations and implement the boundary conditions and a computer implementation to generate a generic code for research as well as for practical applications *Computational Subsurface Hydrology Reactions Transport and Fate* is organized around these themes The fundamental processes occurring in subsurface media are rigorously integrated into governing equations using the Reynolds transport theorem and interactions of these processes with the surrounding media are sophisticatedly cast into various types of boundary conditions using physical reasoning A variety of numerical methods to deal with reactive chemical transport are covered in *Computational Subsurface Hydrology Reactions Transport and Fate* with a particular emphasis on the adaptive local grid refinement and peak capture using the Lagrangian Eulerian approach The topics on coupled fluid flows and reactive chemical transport are unique contributions of this book They serve as a reference for research as well as for practical applications with a computer code that can be purchased from the author Four computer codes to simulate vertically integrated horizontal solute transport LEMA contaminant transport in moving phreatic aquifers in three dimensions 3DLEMA solute transport in variably saturated flows in two dimensions LEWASTE and solute transport under variably saturated flows in three dimensions 3DLEWASTE are covered These four computer codes are designed for generic applications to both research and practical problems They could be used to simulate most of the practical real world field problems Reactive chemical transport and its coupling with fluid flows are unique features in this book Theories numerical implementations and example problems of coupled reactive transport and flows in variably saturated media are presented A generic computer code HYDROGEOCHEM 3.0 is developed A total of eight example problems are used to illustrate the

application of the computational model These problems are intended to serve as examples for setting up a variety of simulations that one may encounter in research and field site applications Computational Subsurface Hydrology Reactions Transport and Fate offers practicing engineers and scientists a theoretical background numerical methods and computer codes for modeling contaminant transport in subsurface media It also serves as a textbook for senior and graduate course on reactive chemical transport in subsurface media in disciplines such as civil and environmental engineering agricultural engineering geosciences soil sciences and chemical engineering Computational Subsurface Hydrology Reactions Transport and Fate presents a systematic derivation of governing equations and boundary conditions of subsurface contaminant transport as well as reaction based geochemical and biochemical processes It discusses a variety of numerical methods for moving sharp front problems expounds detail procedures of constructing Lagrangian Eulerian finite element methods and describes precise implementation of computer codes as they are applied to subsurface contaminant transport and biogeochemical reactions
