A Tutorial on the WKB Approximation for Innovative Dirac Materials Andrii Iurov, 2024-08-30 This textbook serves to supplement existing quantum mechanics courses with the WKB Wentzel Kramers Brillouin theory for recently discovered Dirac materials such as graphene a dice lattice and alpha T3 materials This includes finding the semiclassical wave function coordinate dependent momentum semiclassical action the complete set of transport equations and applicability conditions for the approximation The discovery of graphene and its unique electronic behavior has transformed research in condensed matter physics over the last 10 15 years but core curriculum in standard graduate level physics courses still does not reflect these new developments and this book intends to close this gap With a clear focus on various types of Dirac Hamiltonians the multidimensional theory is only a small part of the book The derivation of the WKB equations for novel Dirac materials and their applications to electron tunneling turning points and classically forbidden regions resonances and localized states and many other crucial physical problems are methodically presented This textbook aims to expand the existing approach to presenting the WKB approximation and covers recent developments in its applications This book also includes many informative graphics as well as problems and exercises with hints at the end of each chapter Additional detailed

mathematical derivations as well as code in Mathematica are added throughout the whole book Ideal for graduate students and researchers in condensed matter physics this textbook serves as a modern guide for learning the WKB theory
