search and optimization problems naturally involve multiple criteria as objectives Generally symmetry asymmetry and anti symmetry are basic characteristics of binary relationships used when modeling optimization problems Moreover the notion of symmetry has appeared in many articles about uncertainty theories that are employed in multi criteria problems Different solutions may produce trade offs conflicting scenarios among different objectives A better solution with respect to one objective may compromise other objectives There are various factors that need to be considered to address the problems in multidisciplinary research which is critical for the overall sustainability of human development and activity In this regard in recent decades decision making theory has been the subject of intense research activities due to its wide applications in different areas The decision making theory approach has become an important means to provide real time solutions to uncertainty problems Theories such as probability theory fuzzy set theory type 2 fuzzy set theory rough set and uncertainty theory available in the existing literature deal with such uncertainties Nevertheless the uncertain multi criteria characteristics in such problems have not yet been explored in depth and there is much left to be achieved in this direction Hence different mathematical models of real life multi criteria optimization problems can be developed in various uncertain frameworks with special emphasis on optimization problems **Operation and Maintenance of a Gas Insulated**

Substation Prasun Barua, A primary distinction between conventional Air Insulated Substations AIS and Gas Insulated Substations GIS lies in the configuration of the electrical components In GIS the SF gas insulated components are enclosed within a grounded pressurized metallic housing This encapsulation fundamentally changes the operation of switchgear components such as circuit breakers disconnectors and earthing switches as it eliminates the possibility of direct visual inspection or observation of the disconnector gap or earthing switch status in open or closed positions In addition to this

fundamental difference GIS technology introduces several specialized operational characteristics These include the use of viewports cameras and endoscopes for internal inspections considerations regarding induced currents in metallic enclosures various alarm systems local control cubicles remote control capabilities mimic diagram schemes gas compartment zoning and the concept of unmanned substations The maintenance section of this book draws from practical field experience with GIS systems that have been operational for several years It discusses the types and origins of defects their repair procedures and the intricate planning involved Standard maintenance techniques are outlined including procedures to assess the quality of the SF insulating gas visual and optical inspection methods management of gas handling records and routines for detecting gas leaks Furthermore the book explores specialized practices involving interlocks gas zone configurations spare parts management and the use of dedicated maintenance equipment Lessons learned from experience are shared regarding gas zone identification secondary system interfaces and wiring techniques Preconstruction training of personnel continuous condition monitoring GIS retrofitting and maintenance of busbar gas leaks are also addressed The book also covers the GIS repair process in detail It provides information on the types of defects that typically necessitate repair in GIS systems the estimated duration of such repairs and how service continuity is influenced by system design Additionally the book explains the procedures for extending a GIS installation after years of operation It outlines the definition and configuration of the interface between two GIS systems of varying dimensions It details the scope of work required when extension was not foreseen during the original design phase how to maintain service continuity during the extension process and the methods for verifying the new interface post extension Further the book elaborates on the process of retrofitting GIS installations for upgrades It discusses the challenges posed by aging switchgear systems and provides in depth guidance on modernizing or upgrading existing substations Particular focus is given to the replacement of circuit breakers within GIS installations to enhance switching capability The issue of GIS equipment overloading is examined along with the principles governing continuous current ratings under specified thermal and dielectric conditions in substation design The book also addresses the determination of thermal limits in accordance with IEEE and IEC standards discusses the maximum allowable continuous load current short term overload capacity and includes equations necessary for calculating overload conditions **NTPC**
