Algorithms and Architectures for Cryptography and Source Coding in Non-Volatile Flash Memories Malek Safieh,2021-08-09 In this work algorithms and architectures for cryptography and source coding are developed which are suitable for many resource constrained embedded systems such as non volatile flash memories A new concept for elliptic curve cryptography is presented which uses an arithmetic over Gaussian integers Gaussian integers are a subset of the complex numbers with integers as real and imaginary parts Ordinary modular arithmetic over Gaussian integers is computationally expensive To reduce the complexity a new arithmetic based on the Montgomery reduction is presented For the elliptic curve point multiplication this arithmetic over Gaussian integers improves the computational efficiency the resistance against side channel attacks and reduces the memory requirements Furthermore an efficient variant of the Lempel Ziv Welch LZW algorithm for universal lossless data compression is investigated Instead of one LZW dictionary this algorithm applies several dictionaries to speed up the encoding process Two dictionary partitioning techniques are introduced that improve the compression rate and reduce the memory size of this parallel dictionary LZW algorithm
