Modeling of Mn/ROAD Test Sections with the CRREL Mechanistic Pavement Design Procedure Susan R.

Bigl, 1996 The U S Army Cold Regions Research and Engineering Laboratory is developing a mechanistic pavement design

procedure for use in seasonal frost areas The procedure was used to predict pavement performance of some test sections

under construction at the Mn ROAD facility Simulations were conducted in three phases investigating the effects on

predictions of water table position subgrade characteristics asphalt model and freeze season characteristics The procedure

predicted significantly different performance by the different test sections and highly variable results depending on the

performance model applied The simulated performance of the tests sections also was greatly affected by the subgrade

conditions e g density soil moisture and water table depth In general predictions for the full depth asphalt sections indicate

that they will not fail due to cracking but two of the three criteria for subgrade rutting indicate failure before the five or 10

year design life of the sections Conventional sections are predicted not to fail due to subgrade rutting however sections

including the more frost susceptible bases in their design are predicted to fail due to asphalt cracking relatively early in their

design life and sections with nonfrost susceptible bases are predicted to fail towards the end of the design life
