

# How Home Air Conditioning Units Work

An AC is divided into two main parts: one half inside of your home containing an evaporator coil and a filter, and an outer half with a condensing coil, fan, and compressor. These two halves work in tandem in an intricate way to keep your home cool:

## 1. Condenser Coil:

The condenser coil, located outside your home in a split system HVAC, cools down the high-pressure gas that is sent to it from the compressor and changes it back into a liquid. The condenser ensures that heat is removed from the refrigerant. From here the liquid travels to the evaporator coil.

## 2. Evaporator Coil:

The evaporator coil is connected to the condenser but can be found in your home's interior. The liquid that is sent from the condenser coil can be found here. The constantly decreasing pressure in the evaporator coil ensures that the liquid is changed into a gas. Your refrigerant will ensure that the gas is sufficiently cooled. Your evaporator coil will absorb all the expelled heat from inside of your home and transfer it back to the condenser to repeat the cooling process.

## 3a. Fan And 3b. Air Handling Unit:

This is split into two components. Your fan can be found outdoors and it expels the heat from your home via the condenser coil. Your air handling unit can be found indoors and utilizing your ductwork, it disperses cool air throughout your home.

## 4. Filter:

Without them you would have a lot of dust, debris and allergens in your home which will affect your indoor air quality. Filters can be cleaned or replaced depending on your specific preferences.

## 5. Thermostat:

Your thermostat enables you to adjust your ac system temperature to levels that you feel comfortable with. It will ensure that your specific rooms or household will remain at your selected temperature by constantly testing and regulating the temperature in your room.

*Smart Energy Empowerment in Smart and Resilient Cities*  
Mustapha Hatti, 2019-12-24 International Conference on Artificial Intelligence in Renewable Energetic Systems IC  
AIRES2019 26-28 November 2019 Taghit Bechar, Algeria

The challenges of the energy transition in the medium term lead to numerous technological breakthroughs in the areas of production, optimal distribution, and the rational use of energy and renewable energy, energy efficiency, and optimization of consumption, massive electrification, monitoring and control, energy systems, cogeneration, and energy recovery processes, new and renewable energies, etc. The fall in the cost of renewable energies and the desire for a local control of energy production are today calling for a profound change in the electricity system. Local authorities are at the center of energy developments by taking into account the local nature of certain energy systems: heat networks, geothermal energy, waste heat recovery, and electricity generation from household waste. On the other side, digital sciences are at the heart of connected objects and intelligent products that combine information processing and communication capabilities with their environment. Digital technology is at the center of new systems engineering approaches: 3D modeling, virtualization, simulation, digital prototyping, etc. for the design and development of intelligent systems. The book deals with various topics ranging from the design, development, and maintenance of energy production systems, transport, distribution, or storage of energy, optimization of energy efficiency, especially in the use of energy, innovation in the fields of energy production from renewable energies, management of energy networks, electricity, fluids, gas, district heating, energy storage modes, battery, super capacitors, overseeing energy supply through supervision, control, and diagnosis, risk management, as well as the design and management of smart grids, microgrid, smartgrid. This imposes the model of energy empowerment in the advent of smart cities.
