

REPRODUCTIVE SYSTEM

PENIS ANATOMY

Human Male Reproductive System:

Normal body temperature is too hot, thus is lethal to sperm so the testes are outside of the abdominal cavity where the temperature is about 2°C (3.6°F) lower. Note also that a woman's body temperature is lowest around the time of ovulation to help insure sperm take longer to reach the egg. If a man takes too many long, very hot baths, this can reduce his sperm count. Undescended testes (testes are supposed to descend before birth) will cause sterility because their environment is too warm for sperm viability unless the problem can be surgically corrected. (Undescended testes are also very prone to developing cancer, thus if they cannot be surgically moved, they probably will need to be removed.)

From there, sperm are transferred to the epididymis, called tubules also found within the scrotum, that store sperm and are the site of their final maturation.

In ejaculation, sperm are forced up into the vas deferens (plural = vasa

deferentia). From the epididymis, the vas deferens goes up, around the front of, over the top of, and behind the bladder. A vasectomy is a fairly simple, outpatient operation that involves making a small slit in each scrotum, cutting the vasa deferentia near where they begin, and tying off the cut ends to prevent sperm from leaving the scrotum. Because this is a relatively non-invasive procedure (as compared to doing the same to a woman's oviducts), this is a popular method of permanent birth control once a couple has had all the children they desire. (Couples should carefully weigh their options, because this (and the corresponding female procedure) is not designed to be a reversible operation.)

The ends of the vasa deferentia, behind and slightly under the bladder, are called the ejaculatory ducts. The seminal vesicles are also located behind the bladder. Their secretions are about 60% of the total volume of the semen (= sperm and associated fluid) and contain mucus, amino acids, fructose as the main energy source for the sperm, and prostaglandins to stimulate female uterine contractions to move the semen up into the uterus. The seminal vesicles empty into the ejaculatory ducts. The ejaculatory ducts then empty into the urethra (which, in males, also empties the urinary bladder).

The initial segment of the urethra is surrounded by the prostate gland (note spelling!). The prostate is the largest of the accessory glands and puts its secretions directly into the urethra. These secretions are alkaline to buffer any residual urine, which tends to be acidic, and the acidity of the woman's vagina.
