Scientific Approach Principle for New Resilient Coastal Landscape Design Anahita Kianous, 2017-06-25 Due to recent climate change the character of environmental regional planning has shifted to address the anticipated extreme increases in sea level rise. As such, this project based on existing scientific research data proposes a spatial habitable landscape architectural solution as a model for flood mitigation for the East coastal edge. This proposal tests the potential for resilient coastal landscapes through a particular site located on Revere Beach along with the New England coast in Massachusetts. The study demonstrates how through new public spaces designed to renew and protect the beach and the broader offshores residents and visitors will be able to engage with this 21st Century resilient beachfront. Also residents and visitors will experience sophisticated efficient flood alleviation strategies during natural successive storm events. The inherent goal of this proposal is to create an innovative design intervention which applies new principles of resiliency to the coastal landscape through a technical and cultural solution and which can be a replicable model for global coastal edges elsewhere. Revitalizing Revere Beach, MA is a case study to mitigate floods based on Bernoulli's principle. This proposal projects an idea of connecting puddles with fissures a set of Flute Channels which is my innovation design approach to transfer water from coast to wetland behind it. It helps to lower down the sea level in high tides and sudden tides. Retrofitting Revere Beach as a case study for flood mitigation with a New Resilient Coastal Landscape approach started to study the watershed of the East Coast that includes three parts of North Mid Atlantic and South Atlantic. Each has a flow that moves up and then inward to the east in a concave pattern precipitated scale toward the north caused by the velocity of currents. In compare to the Pacific coast this figuration came to appear as the convex pattern as the currents also are affected differently based on the climate and the land used materials. The project focused on how to manipulate waves and the currents to preserve the land figuration and creates the natural coastal landscape. Geo Technical research and scientific data is the fundamental study that I got the benefit of understanding the exact waves motion density velocity of water and how the different type of currents affect the land shape. My project is translating the science into landscape architecture. Earth and ocean are not sustainable they're dynamic they're shifting they're changing the landscape and coast components land used material as such salty sand beaches and ripple effects of waves affect the land in different ways. My hypothesis idea of retrofitting coastal landscape backs to its natural creation which will be a combination of four components of barrier islands bay or lagoon thumb lands or forelands and wetlands. These four figurations are shaped based on different wave motions and currents. I discovered two scales of the solution Short and long term phasing. For the long term I suggested floating island which I examined it by the different objects adding to the coral reef at the Revere Beach. Objective found a missing part of coastal components the floating islands. And Flute Channel was innovative design approached by science data of Bernoulli's principle. In this term water transferred from coast to the wetlands behind it. The connected containers science data was a combination solution to this creation. Due

**Bursting the Bubble: Rationality in a Seemingly Irrational Market** David F. DeRosa, 2021-04-02 The presence of speculative bubbles in capital markets an important area of interest in financial history is widely accepted across many circles Talk of them is pervasive in the media and especially in the popular financial press Bubbles are thought to be found primarily in the stock market which is our main interest although bubbles are said to occur in other markets Bubbles go hand in hand with the notion that markets can be irrational The academic community has a great interest in bubbles and it has produced scholarly literature that is voluminous For some economists doing bubble research is like joining the vanguard of a Kuhnian paradigm shift in economic thinking Not so fast If bubbles did exist they would pose a serious challenge to neoclassical finance Bubbles would contradict the ideas that markets are rational or work in an informationally efficient manner That's what makes the topic of bubbles interesting This book reviews and evaluates the academic literature as well as some popular investment books on the possible existence of speculative bubbles in the stock market The main question is whether there is convincing empirical evidence that bubbles exist A second question is whether the theoretical concepts that have been advanced for bubbles make them plausible The reader will discover that I am skeptical that bubbles actually exist But I do not think I or anyone else will ever be able to conclusively prove that there has never been a bubble From studying the literature and from reading history I find that many famous purported bubbles reflect inaccurate history or mistakes in analysis or simply cannot be shown to have existed In other instances bubbles might have existed But in each of those cases there are credible rational explanations And good evidence exists for the idea that even if bubbles do exist they are not of great importance to understanding the stock market **100**
