Guide for Reading

Build Vocabulary

Word Forms When discussing the two types of variables, explain that one meaning of *manipulate* is “to manage or control” and one meaning of *response* is “to answer or act in turn.”

Reading Strategy

Use Prior Knowledge Before students read the section, ask them what they know about the scientific method.

2 INSTRUCT

Connecting to Your World

Have students read the opening paragraph and look at the photo. Ask, **What made Fleming different from other scientists who had seen this mold?** (Fleming recognized the importance of this discovery. He assumed that the mold had released a chemical that prevented the growth of bacteria.)

Alchemy

Relate

Students who have read the Harry Potter books will be familiar with the name of one alchemist, Nicolas Flamel (1330–1414), who wrote a book about the philosopher’s stone. Alchemists believed that the philosopher’s stone could change base metals into gold.

20 Chapter 1

Connecting to Your World

In 1928, Alexander Fleming, a Scottish scientist, noticed that a bacteria he was studying did not grow in the presence of a yellow-green mold. Other scientists had made the same observation, but Fleming was the first to recognize its importance. He assumed that the mold had released a chemical that prevented the growth of the bacteria. That chemical was penicillin, which can kill a wide range of harmful bacteria. In 1945, Fleming shared a Nobel Prize for Medicine with Howard Florey and Ernst Chain, who led the team that isolated penicillin. In this section you will study the methods scientists use to solve problems.

Alchemy

The word *chemistry* comes from alchemy. Long before there were chemists, alchemists were studying matter. Alchemy arose independently in many regions of the world. It was practiced in China and India as early as 400 B.C. In the eighth century, Arabs brought alchemy to Spain, from where it spread quickly to other parts of Europe.

Alchemy had a practical side and a mystical side. Practical alchemy focused on developing techniques for working with metals, glass, and dyes. Mystical alchemy focused on concepts like perfection. Because gold was seen as the perfect metal, alchemists were searching for a way to change other metals, such as lead, into gold. Although alchemists did not succeed in this quest, the work they did spurred the development of chemistry.

Alchemists developed the tools and techniques for working with chemicals. Alchemists developed processes for separating mixtures and purifying chemicals. They designed equipment that is still used today, including beakers, flasks, tongs, funnels, and the mortar and pestle in Figure 1.15. What they did not do was provide a logical set of explanations for the changes in matter that they observed. That task was left for chemists to accomplish.

Figure 1.15 A bowl-shaped mortar and a club-shaped pestle are used to grind or crush materials such as herbs, spices, and paint pigments. The mortar and pestle in the photograph is made of porcelain, which is a hard material.

Prentice Hall Chemistry Chapter 1 answers:

Prentice Hall Chemistry, 2000 **The Handy Chemistry Answer Book** Justin P. Lomont, Ian C. Stewart, 2013-10-01

Don't be mixed up about chemistry. Simplify the complex chemical reactions that take place everywhere in our lives with this engaging, easy-to-follow question and answer guide. Where would we be without atoms and compounds? Gas, liquids, solids, and plasma. Acids and bases. Bonds and reactions. Matter and energy. The Handy Chemistry Answer Book covers the building blocks of life and the universe. The secret life of atoms. How polar bears aren't actually white. Why oil and water don't mix. And much, much more are revealed and explained. This informative guide covers the basics of chemistry: history, atomic structures, chemical bonds, and reactions; organic and inorganic chemistry; to more advanced material: nuclear chemistry, biochemistry, physical and theoretical chemistry. By answering nearly 1,000 common chemistry questions, including: What causes lightning? How does photosynthesis work? What are hard and soft Lewis acids and bases? What makes a fabric waterproof? What are the twelve principles of green chemistry? When did alchemists finally abandon trying to make gold? What is Le Chatelier's principle? What do the different octane ratings mean at the gas pump? What is genetic engineering? Why is calcium important for strong bones? What is the 18-electron rule? Why does chocolate turn white as it ages? Chemical reactions that rule the world: their properties, structure, composition, behavior, and history are tackled and explained in plain English in The Handy Chemistry Answer Book. With many photos, illustrations, a few formulas, molecular diagrams, and other graphics, this fun, fact-filled tome is richly illustrated. A history of chemistry, timeline, appendices on Nobel Prize in Chemistry winners, a bibliography, further reading section, glossary of terms, a table of physical constants, a table of conversion factors, and extensive index add to its usefulness.

Computational Chemistry Errol G. Lewars, 2010-11-10. This corrected second edition contains new material which includes solvent effects, the treatment of singlet diradicals, and the fundamentals of computational chemistry. Computational Chemistry: Introduction to the Theory and Applications of Molecular and Quantum Mechanics is an invaluable tool for teaching and researchers alike. The book provides an overview of the field, explains the basic underlying theory at a meaningful level that is not beyond beginners, and it gives numerous comparisons of different methods with one another and with experiment. The following concepts are illustrated, and their possibilities and limitations are given: potential energy surfaces, simple and extended Hückel methods, *ab initio* AM1, and related semiempirical methods, density functional theory, DFT. Topics are placed in a historical context, adding interest to them and removing much of their apparently arbitrary aspect. The large number of references to all significant topics mentioned should make this book useful not only to undergraduates but also to graduate students and academic and industrial researchers.

Biophysical Chemistry Charles R. Cantor, Paul Reinhard Schimmel, 1980. **Biochemistry** Donald Voet, Judith G. Voet, 2010-11-16. The Gold Standard in Biochemistry text books. Biochemistry 4e is a modern classic that has been thoroughly revised. Don and Judy Voet explain biochemical concepts while offering a unified presentation of life and its variation through evolution. Incorporates both classical and current

research to illustrate the historical source of much of our biochemical knowledge

An Introduction to Spectroscopy, Atomic Structure and Chemical Bonding Terry L. Meek, 1998 An Introduction to Spectroscopy presents the most fundamental concepts of inorganic chemistry at a level appropriate for first year students and in a manner comprehensible to them This is true even of difficult topics such as the wave mechanical atom symmetry elements and symmetry operations and the ligand group orbital approach to bonding The book contains many useful diagrams illustrating among other things the angular dependence of atomic wave functions the derivation of energy level diagrams for polyatomic molecules close packed lattices and ionic crystal structures The diagrams of the periodic variation of atomic and molecular properties showing trends across periods and down groups simultaneously are especially instructive Spectroscopy is presented mainly as a tool for the elucidation of atomic and molecular structures Each chapter begins with a clear and concise statement of What Every First year Student Should Know About outlining the background knowledge that the student is assumed to have from previous courses and thus pointing out what topics might need to be reviewed There are also detailed statements of the objectives of each chapter a number of worked examples interspersed in the text and a comprehensive set of problems and exercises to test the student's understanding Tables of data throughout the text and appendices at the end provide much valuable information

Between Technology and Science Martin Meyer, 2005-02 This dissertation addresses emerging developer communities in a new field of science and technology as well as methods to

capture exchange processes between them. It contributes to the discussion about a new mode of knowledge production and a changing division of labour between public research industry and government by investigating nanotechnology an emerging area between science and technology. To explore exchange processes in this field the study applies various methods. In particular it uses patent citation analysis. The methodological contribution is a new interpretation of this indicator which sees patent citations as information flows that point to reciprocal exchange processes and potential overlaps between science and technology. This is in contrast to the received interpretation which suffers from the application of a framework that was developed in the context of scholarly citation and does not fully appreciate that a patent citation is established by the patent examiner a party external to the inventive process. Various formats of patent citation analysis describe nanotechnology as a set of instrument driven scientific fields on their way towards science related technologies. Even though nanotechnology patents contain more patent citations to the scientific literature than other technical fields the science and technology systems are relatively autonomous. What links them in the case of nano science and technology is a common interest in improving techniques of nano scale measurement and manipulation. Another finding is that both countries and firms exhibit relatively strong path dependencies. While nanotechnology comprises a key set of technological areas instrumentation electronics and pharmaceuticals chemicals nano scale activities vary considerably from country to country. Also knowledge building activities of firms follow a strong technological path dependency. As a result social capital seems to be confined to chiefly technological or scientific trajectories. Hence social capital appears not to be very useful in explaining how knowledge is accumulated and integrated at the nano scale. Given the central role of instrumentation and the mediated nature of exchange between science and technology at the nano scale public policies should be directed towards supporting education and infrastructure in the area rather than more direct transfer mechanisms.
