Innovation in Pharmacy: Advances and Perspectives. September 2018 Organizer Committee IPAP18 - Salamanca, 2018-09-21. This book contains the summaries of the Innovation in Pharmacy Advances and Perspectives that took place in Salamanca, Spain, in September 2018. The early science of chemistry and microbiology were the source of most drugs until the revolution of genetic engineering in the mid 1970s. Then biotechnology made available novel protein agents such as interferons, blood factors, and monoclonal antibodies that have changed the modern pharmacy. Over the past year, a new pharmacy of oligonucleotides has emerged from the science of gene expression such as RNA splicing and RNA interference. The ability to design therapeutic agents from genomic sequences will transform treatment for many diseases. The science that created this advance and its future promise will be discussed.

Phillip Allen Sharp is an American geneticist and molecular biologist who co-discovered RNA splicing. He shared the 1993 Nobel Prize in Physiology or Medicine with Richard J. Roberts for the discovery that genes in eukaryotes are not contiguous strings but contain introns and that the splicing of messenger RNA to delete those introns can occur in different ways, yielding different proteins from the same DNA sequence. He works in the Institute Professor Koch Institute for Integrative Cancer Research, Massachusetts Institute of Technology, MIT, Cambridge, MA, USA.

Este libro recoge los resultados de la Innovation in Pharmacy Advances and Perspectives que tuvo lugar en Salamanca, España, en septiembre de 2018. La ciencia primitiva de la química y la microbiología fue la fuente de la mayoría de las drogas hasta la revolución de la ingeniería genética a mediados de la década de 1970. Luego, la biotecnología puso a disposición agentes proteicos novedosos como interferones, factores sanguíneos y anticuerpos monoclonales que han cambiado la farmacia moderna. Durante el año pasado surgió una nueva farmacia de oligonucleótidos a partir de la ciencia de la expresión génica como el empalme de ARN y la interferencia de ARN. La capacidad de diseñar agentes terapéuticos a partir de secuencias genómicas transformará el tratamiento de muchas enfermedades. La ciencia que creó este avance y su promesa futura serán discutidas.

Phillip Allen Sharp es un genetista y biólogo molecular estadounidense que co-descubrió el empalme de ARN. Compartió el Premio Nobel de 1993 en Fisiología o Medicina con Richard J. Roberts por el descubrimiento de que los genes en eucariotas no son cadenas contiguas sino que contienen intrones y que el empalme del ARN mensajero para eliminar esos intrones puede ocurrir de diferentes maneras produciendo diferentes proteínas de la misma secuencia de ADN. Trabaja en el Instituto Profesor Koch, Instituto Tecnológico de Massachusetts, MIT, Cambridge, MA, EE. UU.
