**Neuroscience Research at the Crossroads of Nutrition, Psychology, and Neuroscience** Aron K. Barbey,Elizabeth J.

Johnson, Margaret Joy Dauncey, 2019-01-23 Nutritional Cognitive Neuroscience is an emerging interdisciplinary field of research that seeks to understand nutrition's impact on human cognition and brain health across the life span. Research in this burgeoning field demonstrates that many aspects of nutrition, from entire diets to specific nutrients, affect brain structure and function and therefore have profound implications for understanding the nature of psychological health, aging, and disease. The aim of this Research Topic in Frontiers in Aging Neuroscience is to examine recent empirical and theoretical contributions from Nutritional Cognitive Neuroscience with an emphasis on the following primary areas of inquiry: Nutrition and Brain Health. An enduring aim of research in the nutritional sciences is to discover specific nutrients and dietary patterns that enhance cognitive function and brain health in the elderly. Although an abundance of evidence supports a single or a few nutrients for the promotion of cognitive performance and brain health, clinical trials using nutritional supplementation have been predominately unsuccessful. Further research is therefore needed to better characterize the contributions of specific nutrients and nutrient combinations to cognitive performance and brain health. Moderators of Nutrition's Impact on the Brain. A second major area of research in Nutritional Cognitive Neuroscience investigates the mechanisms that underlie the effects of nutrition on brain health at the cellular, molecular, and circuit levels. Accumulating evidence indicates that the effects of nutrition on brain health are complex and multifactorial, reflecting the influence of particular nutrient combinations on specific brain networks and taking into account several moderating factors. Considerably more research is needed to elucidate the complex interactions between nutrition and known moderating variables, including age, nutritional status, genes, environment, and lifestyle, in determining nutrition's impact on cognitive function and brain health. Personalized Nutrition. Research at the frontiers of Nutritional Cognitive Neuroscience establishes a personalized approach to nutritional intervention that takes into account individual variability in nutritional status, brain health, genes, environment, and lifestyle. The goal of personalized nutrition is to enhance the precision of nutritional intervention and to enable novel applications to psychological health, aging, and disease.

Complex Problem Solving Peter A. Frensch, Joachim Funke, 2014-04-04

This volume presents a state of the science review of the most promising current European research and its historic roots of research on complex problem solving CPS in Europe It is an attempt to close the knowledge gap among American scholars regarding the European approach to understanding CPS Although most of the American researchers are well aware of the fact that CPS has been a very active research area in Europe for quite some time they do not know any specifics about even the most important research Part of the reason for this lack of knowledge is undoubtedly the fact that European researchers for the most part have been rather reluctant to publish their work in English language journals The book concentrates on European research because the basic approach European scholars have taken to studying CPS is very different from one taken by North American researchers Traditionally American scholars have been studying CPS in natural domains physics reading writing and chess playing concentrating primarily on exploring novice expert differences and the acquisition of a complex skill European scholars in contrast have been primarily concerned with problem solving behavior in artificially generated mostly computerized complex systems While the American approach has the advantage of high external validity the European approach has the advantage of system variables that can be systematically manipulated to reveal the effects of system parameters on CPS behavior The two approaches are thus best viewed as complementing each other This volume contains contributions from four European countries Sweden Switzerland Great Britain and Germany As such it accurately represents the bulk of empirical research on CPS which has been conducted in Europe An international cooperation started two years ago with the goal of bringing the European research on complex problem solving to the awareness of American scholars A direct result of that effort the contributions to this book are both informative and comprehensive
