Transmission and Processing Saeid Mokhatab, William A. Poe, John Y. Mak, 2018-10-26 Written by an internationally recognized team of natural gas industry experts the fourth edition of Handbook of Natural Gas Transmission and Processing is a unique well researched and comprehensive work on the design and operation aspects of natural gas transmission and processing Six new chapters have been added to include detailed discussion of the thermodynamic and energy efficiency of relevant processes and recent developments in treating super rich gas high CO₂ content gas and high nitrogen content gas with other contaminants The new material describes technologies for processing today's unconventional gases providing a fresh approach in solving today's gas processing challenges including greenhouse gas emissions The updated edition is an excellent platform for gas processors and educators to understand the basic principles and innovative designs necessary to meet today's environmental and sustainability requirement while delivering acceptable project economics Covers all technical and operational aspects of natural gas transmission and processing Provides pivotal updates on the latest technologies applications and solutions Helps to understand today's natural gas resources and the best gas processing technologies Offers design optimization and advice on the design and operation of gas plants **Air Pollution Engineering**

Manual Air & Waste Management Association, 2000-04-06 This manual characterizes air pollutant emission sources and the technology available to control them It provides industry and government with the guidelines to comply with air pollution standards and equipment used for gases and particulates **Designing Controls for the Process Industries** Wayne Seames, 2023-11-30 Offering a modern process oriented approach emphasizing process control scheme development instead of extended coverage of Laplace space descriptions of process dynamics Designing Controls for the Process Industries focuses on aspects that are most important for contemporary practical process engineering and reflects the industry's use of digital distributed control based systems The second edition now features 60 tutorial videos demonstrating solutions to most of the example problems Instead of starting with the controller the book starts with the process and moves on to how basic regulatory control schemes can be designed to achieve the process objectives while maintaining stable operations In addition to continuous control concepts process and control system dynamics are embedded into the text with each new concept

presented The book also includes sections on batch and semi batch processes and safety automation within each concept area It discusses the four most common control techniques control loop feedback feedforward ratio and cascade and discusses application of these techniques for process control schemes for the most common types of unit operations It also discusses more advanced and less commonly used regulatory control options such as override allocation and split range controllers includes an introduction to higher level automation functions and provides guidance for ways to increase the overall safety stability and efficiency for many process applications It introduces the theory behind the most common types of controllers used in the process industries and provides various additional plant automation related subjects The new edition also includes new homework problems and examples including multiple choice questions for flipped classes information about statistical process control and a new case study that documents the development of regulatory control schemes for an entire process area Aimed at chemical engineering students in process control courses as well as practicing process and control engineers this textbook offers an alternative to traditional texts and offers a practical hands on approach to design of process controls PowerPoint lecture slides multiple choice quiz questions for each chapter and a solutions manual are available to qualifying instructors Tutorial style videos for most of the text examples are available for all readers to download

environment through closure of material cycles In this second edition the book's structure of Basics Thermodynamic Analysis of Processes Case Studies and Sustainability has been unaffected but a few additions have been made New and updated information includes A new chapter dedicated to the increasing levels of CO₂ emissions with special attention to the removal and storage of CO₂ A new chapter on the rapidly emerging hydrogen economy An extended chapter on lifecycle analysis that examines the fate of the quality of energy during the lifecycle Increased focus on integrating the environment into the thermodynamic analysis of the systems or processes considered New problem sets and exercises Complete with the keys to a quantification of process efficiency and sustainability this cutting edge resource is the ideal guide for those engaged in the transition from fossil based fuels to renewable and sustainable energy sources using low waste procedures

Plant-produced Microbial Vaccines Alexander V. Karasev, 2009-04-29 In recent years plants have been increasingly explored for production of biomedicines and vaccine components The two main advantages of plant systems are low cost and a greater potential for scalability as compared to microbial or animal systems An additional advantage from the public health point of view is high safety compared to animal systems which is important for vaccine production there are no known plant pathogens capable of replicating in animals and in humans in particular A particular antigen or a protein has to be expressed in a plant using one of many available platforms this antigen protein subsequently needs to be purified or processed and later formulated into a vaccine or a therapeutic these need to be delivered to a human or animal body via an appropriate route Naturally all these vaccines and therapeutics must be subjected to regulatory approvals prior to their use Thus the challenge is to adapt plant based platforms for production of cost efficient biomedical products that can be approved by FDA for use as vaccine components or therapeutics which will be competitive against existing vaccines and drugs This volume attempts to address the entire spectrum of challenges facing the nascent field of plant based biomedical products from the selection of an appropriate production platform to specific methods of downstream processing and regulatory approval issues **Efficiency and**
