

Notes: Inverse Variation

Remember that two variables x and y show direct variation if $y = ax$ and $a \neq 0$. The letter "a" represents the "Constant of Variation". The equation for the

Constant of Variation is $a = \frac{y}{x}$

On the contrary, if two variables show **inverse variation**, then they have the equation

$y = \frac{a}{x}$ or $a = yx$.

If two variables vary inversely, the products of every x and y combination are the same.

For example,

x	-3	-2	2
y	6	9	-9

So, $6(-3) = -18$, $9(-2) = -18$, $2(-9) = -18$

So this is another way to identify inverse variation. The Constant of Variation for this example would be $a = 6(-3) = -18$ so the equation would be $y = \frac{-18}{x}$.

Does $xy = 4$ represents an inverse variation? Yes, because we can write it in the form

$y = \frac{a}{x}$ or $y = \frac{4}{x}$.

The equation $\frac{y}{2} = x$ can be written as $y = 2x$ so it represents a direct variation.

The equation $y = 2x + 3$ is neither, as this is not in the form of direct or inverse variation.

Direct Variation	Inverse Variation
$y = ax$	$y = \frac{a}{x}$
$a = \frac{y}{x}$	$a = yx$

Practice 9 Inverse Variation
