Theoretical Foundations for Digital Libraries Edward Alan Fox, Marcos André Gonçalves, Rao Shen, 2012 In 1991 a group of researchers chose the term digital libraries to describe an emerging field of research development and practice Since then Virginia Tech has had funded research in this area largely through its Digital Library Research Laboratory This book is the first in a four book series that reports our key findings and current research investigations Underlying this book series are six completed dissertations Gon alves Kozievitch Leidig Murthy Shen Torres eight dissertations underway and many masters theses These reflect our experience with a long string of prototype or production systems developed in the lab such as CITIDEL CODER CTRnet Ensemble ETANA ETD db MARIAN and Open Digital Libraries There are hundreds of related publications presentations tutorials and reports We have built upon that work so this book and the others in the series will address digital library related needs in many computer science information science and library science e g LIS courses as well as the requirements of researchers developers and practitioners Much of the early work in the digital library field struck a balance between addressing real world needs integrating methods from related areas and advancing an ever expanding research agenda Our work has fit in with these trends but simultaneously has been driven by a desire to provide a firm conceptual and formal basis for the field Our aim has been to move from engineering to science We claim that our 5S Societies Scenarios Spaces Structures Streams framework discussed in publications dating back to at least 1998 provides a suitable basis This book introduces 5S and the key theoretical and formal aspects of the 5S framework While the 5S framework may be used to describe many types of information systems and is likely to have even broader utility and appeal we focus here on digital libraries Our view of digital libraries is broad so further generalization should be straightforward We have connected with related fields including hypertext hypermedia information storage and retrieval knowledge management machine learning multimedia personal information management and Web 2 0 Applications have included managing not only publications but also archaeological information educational resources fish images scientific datasets and scientific experiments simulations Table of Contents Introduction Exploration Mathematical Preliminaries Minimal Digital Library Archaeological Digital Libraries 5S Results Lemmas Proofs and 5SSuite Glossary Bibliography Authors Biographies Index

Computer Algebra Handbook Johannes Grabmeier, Erich Kaltofen, Volker Weispfenning, 2012-12-06 Two ideas lie gleaming on the jeweler s velvet The first is the calculus the second the algorithm The calculus and the rich body of mathematical analysis to which it gave rise made modern science possible but it has been the algorithm that has made possible the modern world David Berlinski The Advent of the Algorithm First there was the concept of integers then there were symbols for integers I II III 1 11 111 fttt what might be called a sticks and stones representation I II III IV V Roman numerals 1 2 3 4 5 Arabic numerals etc Then there were other concepts with symbols for them and algorithms sometimes for manipulating the new symbols Then came collections of mathematical knowledge tables of mathematical computations

theorems of general results Soon after algorithms came devices that provided assistance for carrying out computations Then mathematical knowledge was organized and structured into several related concepts and symbols logic algebra analysis topology algebraic geometry number theory combinatorics etc This organization and abstraction lead to new algorithms and new fields like universal algebra But always our symbol systems reflected and influenced our thinking our concepts and our algorithms

Exploring physics with Geometric Algebra Peeter Joot, This is an exploratory collection of notes containing worked examples of a number of applications of Geometric Algebra GA also known as Clifford Algebra This writing is focused on undergraduate level physics concepts with a target audience of somebody with an undergraduate engineering background i e me at the time of writing These notes are more journal than book You ll find lots of duplication since I reworked some topics from scratch a number of times In many places I was attempting to learn both the basic physics concepts as well as playing with how to express many of those concepts using GA formalisms The page count proves that I did a very poor job of weeding out all the duplication These notes are dis organized into the following

chapters Basics and Geometry This chapter covers a hodge podge collection of topics including GA forms for traditional vector identities Quaternions Cauchy equations Legendre polynomials wedge product representation of a plane bivector and trivector geometry torque and more A couple attempts at producing an introduction to GA concepts are included none of which I was ever happy with Projection Here the concept of reciprocal frame vectors using GA and traditional matrix formalisms is developed Projection rejection and Moore Penrose generalized inverse operations are discussed Rotation GA Rotors Euler angles spherical coordinates blade exponentials rotation generators and infinitesimal rotations are all examined from a GA point of view Calculus Here GA equivalents for a number of vector calculus relations are developed spherical and hyperspherical volume parameterizations are derived some questions about the structure of divergence and curl are examined and tangent planes and normals in 3 and 4 dimensions are examined Wrapping up this chapter is a complete GA formulation of the general Stokes theorem for curvilinear coordinates in Euclidean or non Euclidean spaces is developed General Physics This chapter introduces a bivector form of angular momentum instead of a cross product examines the components of radial velocity and acceleration kinetic energy symplectic structure Newton s method and a center of mass problem for a toroidal segment Relativity This is a fairly incoherent chapter including an attempt to develop the Lorentz transformation by requiring wave equation invariance Lorentz transformation of the four vector STA gradient and a look at the relativistic doppler equation Electrodynamics The GA formulation of Maxwell s equation singular in GA is developed here Various basic topics of electrodynamics are examined using the GA toolbox including the Biot Savart law the covariant form for Maxwell s equation Space Time Algebra or STA four vectors and potentials gauge invariance TEM waves and some Lienard Wiechert problems Lorentz Force Here the GA form of the Lorentz force equation and its relation to the usual vectorial representation is explored This includes some application of boosts to the force equation to examine how it transforms under observe dependent conditions Electrodynamic stress energy This chapter explores concepts of electrodynamic energy and momentum density and the GA representation of the Poynting vector and the stress energy tensors Quantum Mechanics This chapter includes a look at the Dirac Lagrangian and how this can be cast into GA form Properties of the Pauli and Dirac bases are explored and how various matrix operations map onto their GA equivalents A bivector form for the angular momentum operator is examined A multivector form for the first few spherical harmonic eigenfunctions is developed A multivector factorization of the three and four dimensional Laplacian and the angular momentum operators are derived Fourier treatments Solutions to various PDE equations are attempted using Fourier series and transforms Much of this chapter was exploring Fourier solutions to the GA form of Maxwell s equation but a few other non geometric algebra Fourier problems were also tackled

The Science of Quantitative Information Flow Mário S. Alvim,Konstantinos Chatzikokolakis,Annabelle McIver,Carroll Morgan,Catuscia Palamidessi,Geoffrey Smith,2020-09-23 This book presents a comprehensive mathematical theory that explains precisely what information flow is how it can be assessed quantitatively so bringing precise meaning to the intuition that certain information leaks are small enough to be tolerated and how systems can be constructed that achieve rigorous quantitative information flow guarantees in those terms It addresses the fundamental challenge that functional and practical requirements frequently conflict with the goal of preserving confidentiality making perfect security unattainable Topics include a systematic presentation of how unwanted information flow i e leaks can be quantified in operationally significant ways and then bounded both with respect to estimated benefit for an attacking adversary and by comparisons between alternative implementations a detailed study of capacity refinement and Dalenius leakage supporting robust leakage assessments a unification of information theoretic channels and information leaking sequential programs within the same framework and a collection of case studies showing how the theory can be applied to interesting realistic scenarios The text is unified self contained and comprehensive accessible to students and researchers with some knowledge of discrete probability and undergraduate mathematics and contains exercises to facilitate its use as a course textbook *Catalog of*
