EATING HEALTHILY

Eating healthily is an important part of a person's daily life. It helps us stay strong, active and full of energy. We must balance our diet so that we have a healthy body as well as a healthy mind. Eating the right nutrients means that our bodies have everything they need to grow and function well. A mixture of vitamins, minerals, protein, carbohydrates and fats are what we need to help our bodies repair and fight off diseases. If you want to know how to eat a healthy diet, read on.

FATS AND SUGARS

We should only eat a small amount of food from this group. If you eat too many fatty foods, you can gain weight. This could lead to diseases like diabetes.

CARBOHYDRATES

Foods in this group give you energy. Examples are pasta, bread, rice and potatoes. Doctors say that if we are eating a balanced diet, we are even healthier! We should eat pasta and rice as part of a well-balanced diet.

DAIRY AND ALTERNATIVES

Examples are milk, cheese and yogurt. People who are lactose intolerant can get their calcium from soy products.

It is important to get enough of the fat in your diet.

examples of protein

FISH, MEAT, EGGS AND BEANS

These are important for our bodies. They help us to grow. They also help to repair our bodies. Fish, like salmon, are also full of omega-3 fatty acids that are important for our brains. Beans are a good source of protein and fiber.

FRUITS AND VEGETABLES

We should try to eat at least five portions of fruit and vegetables every day. They are full of vitamins and minerals that give us energy. They help keep our bodies strong. Oranges are packed with Vitamin C, which helps our immune system fight off germs. Leafy greens are good for our bones.

The Effects of the COVID-19 Outbreak on Food Supply, Dietary Patterns, Nutrition and Health: Volume 1 Igor Pravst, Betty Pei Ing Chang, Monique Maria Raats, 2022-03-15 The COVID 19 coronavirus outbreak has affected populations across the world In a short time we were exposed to a critical situation faced with numerous medical social and economic challenges While the medical community has focused on developing successful diagnostic and medical treatments many countries

Analyzing the relationship between dietary patterns, health outcomes and individual food choices Francesco Visioli, Francesco Sofi, 2023-01-30 Metabolic Consequences of Changing Dietary Patterns A. P. Simopoulos, 1996-08-26 Dietary patterns have varied over time due to changing agricultural practices and climatic ecological cultural and socioeconomic factors which determine the foods that are available to humans This volume examines the metabolic consequences of recent dietary and other lifestyle changes in selected populations in Asia Australia and Africa Scientific evidence suggests that human beings evolved on a diet that was higher in protein complex carbohydrates fiber vitamin C calcium and nutrient density than the diet of developed and developing countries today The hunter gatherer diet was lower in simple carbohydrates total fat saturated fat and trans fatty acids while also maintaining a balance between the omega 6 and omega 3 polyunsaturated fatty acids The reviews in this volume describe the adverse metabolic effects now occurring in different populations undergoing rapid change and suggest how these detrimental effects on health can be prevented or modified

Innovation and Trends in the Global Food Systems, Dietary Patterns and Healthy Sustainable Lifestyle in the Digital Age, 2nd edition Maha Hoteit, Reema Fayez Tayyem, Radwan Qasrawi, Haleama Al Sabbah, 2023-07-31 All aspects of feeding and nourishing people growing harvesting packaging processing transporting marketing and consuming food are part of the food system Even before the COVID 19 pandemic food systems faced many challenges such as hunger increases which affected up to 811 million people as of 2020 while healthy diets were unaffordable for at least 3 billion people More than 80% of the population affected by hunger and 95% of people unable to afford a healthy diet were found in Asia and Africa

Transformation of the global food system is clearly needed if we wish to embed equity sustainability and health as priorities in food provision and consumption. Some of these transformations will be facilitated through new technologies while others will require public policy shifts, changes in the private agro food industry, actions by civil society and behavioral changes by individuals. In this dynamic context, technology actors and the consumers they serve sit at an important nexus within the food system and have the potential to make decisions that cut across the challenges and opportunities to improve sustainable food system outcomes. Although food security has improved in developed countries, many countries, particularly low to middle income countries (LMIC), suffer from significant food insecurity challenges. In addition, food production accessibility and availability have been further impacted due to the COVID-19 outbreak, causing growing global concerns regarding food security, especially within the most vulnerable communities. Moreover, the transformation of food systems for addressing healthy nutrition, food insecurity and public health issues is a global concern. Food security and nutrition systems are directly related to human well-being and global stability, particularly in a time when diets transition toward increased reliance upon processed foods, increased fast food intake, high consumption of edible oils and sugar-sweetened beverages, lack of physical activities and increased lifestyles worldwide. These changes in lifestyle continue to contribute to the growing pandemic of non-communicable diseases such as obesity, diabetes, hypertension and cardiovascular diseases, which are clearly noticed across the globe. The study of nutrition systems, food security and the roles of technological advances, especially in LMIC, is considered the major factor in understanding food transition and population health. Physical inactivity threatens LMIC public health as it is a prime behavioral risk factor associated with major non-communicable diseases such as coronary heart disease, type 2 diabetes and breast and colon cancer. Its long-term impacts increasingly burden national economies. Decreasing its prevalence is paramount toward decreasing premature mortality and restoring healthy populations. In its most recent iteration of a global action plan for the prevention of non-communicable diseases, the World Health Organization established voluntary global targets to reduce physical inactivity by 10%. Currently, limited published systematic analysis of physical inactivity prevalence among Muslim majority countries exists. Existing literature is concentrated on Arab countries, which represent less than half of all Muslim nations. To date, however, pan-Islamic physical inactivity data have not been reported. Doing so can potentially galvanize religion-specific agencies, e.g., Islamic Relief Worldwide, Organization of Islamic Cooperation, to support efforts aimed at decreasing physical inactivity.
