on Planetary Protection Standards for Icy Bodies in the Outer Solar System,2012-07-10 NASA's exploration of planets and
satellites during the past 50 years has led to the discovery of traces of water ice throughout the solar system and prospects
for large liquid water reservoirs beneath the frozen ICE shells of multiple satellites of the giant planets of the outer solar
system During the coming decades NASA and other space agencies will send flybys orbiters subsurface probes and possibly
landers to these distant worlds in order to explore their geologic and chemical context Because of their potential to harbor
alien life NASA will select missions that target the most habitable outer solar system objects This strategy poses formidable
challenges for mission planners who must balance the opportunity for exploration with the risk of contamination by Earth's
microbes which could confuse the interpretation of data obtained from these objects The 2000 NRC report Preventing the
Forward Contamination of Europa provided a criterion that was adopted with prior recommendations from the Committee on
Space Research of the International Council for Science This current NRC report revisits and extends the findings and
