

Good Stress, Bad Stress, & Deep Focus Work

November 2017

Stress in the workplace can cause problems. For the individual, high stress can create ill health.¹ For the organization, stress can increase absenteeism, healthcare costs, and turnover.² It's understandable that most people want to reduce stress; but, this perspective about stress addresses only one type of stress: distress. Research also indicates that how we think about stress is as important as how much stress we experience, and that the right kind and amount of stress—eustress—helps us reach peak performance.³ From our study in the Haworth Human Performance Lab looking at the effects of visual distractions on focus work, we see how this plays out in the workplace and offer some ways to manage stress for deep focus work.

Stress & Performance: Experiment Results

In our experiment, 50 participants completed a time-sensitive, deep focus task while visual distractions were introduced. To perform perfectly, participants needed to pay attention to the task to complete it accurately (without errors) and quickly. If they took too long, the task would register it as an error. Stress was measured by Galvanic Skin Response (GSR) of electrodermal activity—activity that automatically increases as arousal to a demand increases.⁴ We found that people with zero mistakes had fairly low stress, people with almost no stress made mistakes, and people with the highest stress had the most mistakes. What's going on here? Let's look at these results in terms of percentages of stress (x-axis) and accuracy as a measure of performance (y-axis).

How Stress Impacts Performance

Stress is the body's response to a demand. And, this arousal to respond to any demand is inherently neutral—it's not positive or negative. We influence how to interpret these demands.⁵ We can see demands as challenges and threats. When we find something challenging, we tend to approach it—it is a positive motivator to engage that demand⁶ and one that is necessary for flow.⁷ When we find something threatening, however, we tend to reduce exposure to it or avoid it.

To perform an deep focus, time-sensitive task perfectly, there needs to be some level of stress—the necessary amount of nervous system arousal—to pay attention to the task. Zero errors is, in part, the body's response to the challenge/stressor of performing well on the task. Here is where we see evidence of the right kind and amount of stress having a positive outcome. With too little arousal, not enough attention is being given to the task and people make errors. These people may not have experienced enough of a challenge (or a threat) to be fully engaged in the task. Lastly, the highest amounts of stress occur for those with the highest amounts of errors. Performing poorly at the start of the task and/or seeing the task as too difficult could make completing it a high threat instead of a challenge. Then, starting the task with too much stress only makes matters worse for performance and, as mistakes continue to occur, stress likely continues to increase.

Overall, stress and performance explain 18 percent of any change in each other.

In short, if employees are expected to have high performance under time pressures, they'll be more susceptible to experiencing too much stress—especially if their performance starts to suffer. Working under these kinds of conditions over prolonged periods of time ultimately costs the organization and the employees. Sometimes, however, time pressures are unavoidable.

Research Paper FPL-RP, 1986 *Handbook of Work Stress* Julian Barling, E. Kevin Kelloway, Michael R. Frone, 2004-09-22 Questions about the causes or sources of work stress have been the subject of considerable research as well as public fascination for several decades. Earlier interest in this issue focused on the question of whether some jobs are simply more inherently stressful than others. Other questions that soon emerged asked whether some individuals were more prone to stress than others. The Handbook of Work Stress focuses primarily on identifying the different sources of work stress across different contexts and individuals. Part I focuses on work stressors that have been studied for decades, e.g., organizational role stressors, work schedules, as well as stressors that have received less empirical and public scrutiny, e.g., industrial relations, stress, organizational politics. It also addresses stressors in the workplace that have become relevant more recently, e.g., terrorism. Part II of the Handbook covers issues related to gender, cultural or national origin, older and younger workers, and employment status, and asks how these characteristics might affect the experience of workplace stress. The adverse consequences of these diverse work stressors are manifold, and questions about the possible health consequences of work stressors were one of the major historical factors prompting early interest and research on work stress. In Part III, the individual and organizational consequences of work stress are considered in separate chapters. Key Features: Affords the most broad and credible perspective on the subject of work stress available. The editors are all prominent researchers in the field of work stress and have been instrumental in defining and developing the field from an organizational, psychological, and organizational behavior perspective. International contributors are included, reflecting similarities and differences from around the world. Chapter authors from the United States, Canada, England, Sweden, Japan, and Australia have been invited to participate, reflecting most of the countries in which active research on work stress is taking place. The Handbook of Work Stress is essential reading for researchers in the fields of industrial and organizational psychology, human resources, health psychology, public health, and employee assistance.
