

Part C: Data Collection: Constant Voltage, Changing Resistance

In the second experiment, you will change the resistance to see the effect it has on the current. The Voltage will stay the same (5.0 V). Move the Resistance values to those listed in Data Table 2 and record the current for each setting. Current is recorded in milliamperes (mA).

13. Make a graph of changing resistance v. current and attach it here.

14. What effect does increasing the resistance have on the amount of current through a circuit?

Increasing resistance, decreases the amount of current through a circuit.

15. If the resistance is tripled, the amount of current will be

One third of the initial current.

16. What happened to the current when the Resistance was as low as possible (10 Ohm)?

Current flows is high (100mA).

17. Explain how this lab supports Ohm's Law.

According to the Ohm's law $V=IR$

Current is directly proportional to the Voltage and inversely proportional to the resistance. According to the experiment results, when voltage increases, current was increased. It means current is directly proportional to the voltage. When the resistance increases, current was decreased. It means the current is inversely proportional to the resistance. So, it can be concluded that the Ohm's law was validated during this experiment.
