Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the physical and psychological health of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were 40 sedentary, middle-aged women who were randomly assigned to either a supervised walking program or a control group. The walking program consisted of 12 weeks of supervised walking, 3 times per week, for 30 minutes per session. The control group consisted of 20 women who did not participate in the walking program. The subjects were assessed at baseline and at 12 weeks. The walking program had a significant positive effect on the physical and psychological health of the subjects. The walking program significantly improved the subjects' physical health, as measured by the 6-minute walk test, and their psychological health, as measured by the Beck Depression Inventory and the State-Trait Anxiety Inventory. The walking program also had a significant positive effect on the subjects' quality of life, as measured by the SF-36. The walking program was well tolerated and had no adverse effects. The results of this study suggest that a supervised walking program can be an effective intervention for improving the physical and psychological health of sedentary, middle-aged women.

Abstract The purpose of this study was to determine the effect of a 12-week training program on the physical fitness and health-related quality of life (HRQL) of sedentary, middle-aged women. The study was a randomized, controlled trial. The subjects were randomly assigned to a 12-week training program (n = 20) or a control group (n = 20). The training program consisted of three sessions per week, each lasting 45 minutes. The control group did not participate in any training program. The subjects were assessed at baseline and at 12 weeks. The primary outcome was the change in HRQL, measured using the EuroQol-5D questionnaire. The secondary outcome was the change in physical fitness, measured using the 6-minute walk test. The results showed that the training program had a significant positive effect on HRQL and physical fitness. The subjects in the training group showed a significant increase in HRQL and a significant increase in the 6-minute walk test compared to the control group. The results suggest that a 12-week training program can improve HRQL and physical fitness in sedentary, middle-aged women.
