Abstract

This paper describes the design and implementation of a conversion tool. This tool, called Distributed Computing Environment (DCE) Porting Tool, converts an Open Network Computing (ONC) Remote Procedure Call (RPC) application to a DCE RPC application. The manual intervention needed during the conversion process is minimal. The paper briefly describes RPC programming and highlights the difference between ONC RPC and DCE RPC. The design decisions of the Porting Tool is explained. The implementation uses LEX and YACC (language processing tools supported by Unix) for conversion logic and OSF/MOTIF for Graphical User Interface (GUI). The paper concludes with current limitations of the Tool and the possible future work.

1 INTRODUCTION

In simple terms, **Distributed Processing** means that the (individual) components of an application run (execute) on different nodes in a network. The foremost reason for the current popularity of distributed processing is the modular nature of the applications that are being computed. Many of today's high-end applications are inherently distributed. Reasons for the popularity of distributed processing are: high availability of (low cost) computing facilities (such as hardware, software and network components), ability to share the expensive resources over a network, the availability of large computing power of small computers, and inherent fault tolerance associated with the distribution of computing resources.

From the programming point of view, distributed processing can be categorized into various models (Lockhart, 1994). Here we explain the client-server model, used in this paper. For a discussion of other models refer to (Lockhart, 1994).

In the client server model, each interaction is characterized by an asymmetrical relationship between two software processes. One, the client, makes requests for a service, and

BASIC Microcomputing and Biostatistics Donald W. Rogers, 2012-12-06 BASIC Microcomputing and Biostatistics is designed as the first practical how to guide to both computer programming in BASIC and the statistical data processing techniques needed to analyze experimental clinical and other numerical data It provides a small vocabulary of essential computer statements and shows how they are used to solve problems in the biological physical and medical sciences No mathematical background beyond algebra and an inkling of the principles of calculus is assumed All more advanced mathematical techniques are developed from scratch before they are used The computing language is BASIC a high level language that is easy to learn and widely available using time sharing computer systems and personal microcomputers The strategy of the book is to present computer programming at the outset and to use it throughout BASIC is developed in a way reminiscent of graded readers used in human languages the first programs are so simple that they can be read almost without an introduction to the language Each program thereafter contains new vocabulary and one or more concepts explained in the text not used in the previous ones By gradual stages the reader can progress from programs that do nothing more than count from one to ten to sophisticated programs for nonlinear curve fitting matrix algebra and multiple regression There are 33 working programs and except for the introductory ones each performs a useful function in everyday data processing problems encountered by the experimentalist in many diverse fields
